Vulnerabilidades e Exposições Comuns - Rev 01 - 2021-10-29

Vulnerabilidades e Exposições Comuns - Rev 01 - 2021- Qt		Data de sul Pro " "	do do civili . "	autura Ar Alfant I a A	.h.	da Austria W	Confi~~	later "	Diencellell	
# CVE ID CWE ID # de Explora 1 CVE-2013-0254 264	ções Tipo(s) de vulnerabilidades	06/02/2013	16/06/2021	ontuação Nível de Acesso Ganh 3,6 None	Local Low	Not required F	Partial	Partial	None	The OSharedMemory class in Ot 5.0.0, 4.8.x before 4.8.5, 4.7.x before 4.7.6, and other versions including 4.4.0 uses weak permissions (world-readable and world-writable) for shared memory segments, which allows local users to read sensitive information or modify critical program data, as demonstrated by reading a pixmap being sent to an X server.
2 CVE-2012-6093 310 3 CVE-2012-5624 200		24/02/2013 24/02/2013	16/06/2021 16/06/2021	4,3 None 4,3 None	Remote Medium Remote Medium	Not required F	Partial	None None	None None	The QSxSoxdextexssIErrors function in Qt before 4.8.4, x before 4.8.5, 4.7 x before 4.8.5, when using certain versions of openSSL, uses an "incompatible structure layout" that can read memory from the wrong location, which causes Qt to report an incorrect error when certificate validation fails and might cause users to make unsafe security decisions to accept a certificate. The XML HttpRequest object in Qt before 4.8.4 enables http redirection to the file scheme, which allows man-in-the-middle attackers to force the read of arbitrary local files and possibly obtain sensitive information via a file: URL to a QML application.
4 CVE-2009-2700 20 zlib		02/09/2009	16/06/2021	4,3 None	Remote Medium		None	Partial	None	src/network/ssl/qssicertificate.cpp in Nokia Trolltech QI 4.x does not properly handle a 10' character in a domain name in the Subject Alternative Name field of an X.509 certificate, which allows man-in-the-middle attackers to spoof arbitrary SSL servers via a crafted certificate issue to CVE-2009-2408.
# CVE ID CWE ID # de Explora 1 CVE-2016-9843 189	ções Tipo(s) de vulnerabilidades	23/05/2017	28/07/2020	ontuação Nível de Acesso Ganh 7,5 None	Remote Low	Not required F	Partial	Partial	Partial	The crc32_big function in crc32 c in zilb 1.2.8 might allow context-dependent attackers to have unspecified impact via vectors involving big-endian CRC calculation.
2 CVE-2016-9842 189 3 CVE-2016-9841 189		23/05/2017 23/05/2017	28/07/2020 28/07/2020	6,8 None 7,5 None	Remote Medium Remote Low	Not required F	Partial	Partial Partial	Partial Partial	The inflateMark function in inflate.c in zilb 1.2.8 might allow context-dependent attackers to have unspecified impact via vectors involving left shifts of negative integers. inflast.c in zilb 1.2.8 might allow context-dependent attackers to have unspecified impact by leveraging improper pointer arithmetic.
4 CVE-2016-9840 189 5 CVE-2005-2096	DoS Overflow	23/05/2017 06/07/2005	28/07/2020 19/10/2018	6,8 None 7,5 None	Remote Medium Remote Low	Not required F Not required F		Partial Partial	Partial Partial	inftrees.c in zlib 1.2.8 might allow context-dependent attackers to have unspecified impact by leveraging improper pointer arithmetic. zlib 1.2 and later versions allows remote attackers to cause a denial of service (crash) via a crafted compressed stream with an incomplete code description of a length greater than 1, which leads to a buffer overflow, as demonstrated using a crafted PNG file.
6 CVE-2005-1849 7 CVE-2004-0797	DoS DoS	26/07/2005 20/10/2004	19/10/2018 11/07/2017	5 None 2,1 None	Remote Low Local Low	Not required Not required		None None	Partial Partial	inftrees h in zilb 1.2.2 allows remote attackers to cause a denial of service (application crash) via an invalid file that causes a large dynamic tree to be produced. The error handling in the (1) inflate and (2) inflateBack functions in ZLib compression library 1.2.x allows local users to cause a denial of service (application crash).
8 CVE-2003-0107 9 CVE-2002-0059	DoS Exec Code Overflow Exec Code	07/03/2003 15/03/2002	03/01/2017 03/05/2018	7,5 None 7,5 None	Remote Low Remote Low	Not required F	Partial	Partial Partial	Partial Partial	Buffer overflow in the gzprinff function in zilb 1.1.4, when zilb is compiled without vsprprinff or when long inputs are truncated using vsprprintf, allows attackers to cause a denial of service or possibly execute arbitrary code. The decompression algorithm in zilb 1.1.3 and earlier, as used in many different utilities and packages, causes inflateEnd to release certain memory more than once (a "double free"), which may allow local and remote attackers to execute arbitrary code via a block of malformed compression data.
openssi # CVE ID CWE ID # de Explora		Data de publicação Dat		ontuação Nível de Acesso Ganh					Disponibilidade	The decomplession agonitim in zaid 1.1.3 and came, as used in many uncerent unines and packages, causes innaecha to recease certain memory ince than trice (a "unual nee"), winch may allow local and remote allackers to execute a unitary code in a discover
1 CVE-2021-38604 476 2 CVE-2021-35942 190	DoS	12/08/2021 22/07/2021	07/10/2021 21/09/2021	5 None 6,4 None	Remote Low Remote Low	Not required Not required	None	None None	Partial Partial	In librt in the GNU C Library (aka glibc) through 2.34, sysdeps/unix/sysvilinux/mq_notify.c mishandles certain NOTIFY_REMOVED data, leading to a NULL pointer dereference. NOTE: this vulnerability was introduced as a side effect of the CVE-2021-33574 fix. The wordexp function in the GNU C Library (aka glibc) through 2.33 may crash or read arbitrary memory in parse_param (in posix/wordexpc.c) when called with an untrusted, crafted pattern, potentially resulting in a denial of service or disclosure of information. This occurs because attoi was used but strtoul should have been used to ensure correct calculations.
3 CVE-2021-33574 416	DoS	25/05/2021	07/07/2021	7,5 None	Remote Low	Not required F	Partial	Partial	Partial	The mq_notify function in the GNU C Library (aka glibc) versions 2.32 and 2.33 has a use-after-free. It may use the notification thread attributes object (passed through its struct sigevent parameter) after it has been freed by the caller, leading to a denial of service (application crash) or possibly unspecified other impact.
4 CVE-2021-27645 415 5 CVE-2021-3326 617	DoS DoS	24/02/2021 27/01/2021	06/07/2021 06/07/2021	1,9 None 5 None	Local Medium Remote Low	Not required Not required	None	None None	Partial Partial	The nameserver caching daemon (nscd) in the GNU C Library (aka glibc or libcó) 2.29 (through 2.33, when processing a request for netgroup lookup, may crash due to a double-free, potentially resulting in degraded service or Denial of Service on the local system. This is related to netgroupcache.c. The iconv function in the GNU C Library (aka glibc or libcó) 2.32 and earlier, when processing invalid input sequences in the ISO-2022-JP-3 encoding, fails an assertion in the code path and aborts the program, potentially resulting in a denial of service.
6 CVE-2020-29573 787 7 CVE-2020-29562 617	Overflow DoS	06/12/2020 04/12/2020	26/01/2021 19/03/2021	5 None 2,1 None	Remote Low Remote High	•	None None	None None	Partial Partial	sysdeps/i386/ldbl2mpn.c in the GNU C Library (aka glibc or libc6) before 2.23 on x86 targets has a stack-based buffer overflow if the input to any of the printf family of functions is an 80-bit long double with a non-canonical bit pattern, as seen when passing a \text{NOVINOVIXOVIXOVIXOVIXOVIXOVIXOVIXOVIXOVIXOVIX
8 CVE-2020-27618 835 9 CVE-2020-10029 119	DoS Overflow	26/02/2021 04/03/2020	06/07/2021 21/07/2021	2,1 None 2,1 None	Local Low Local Low	Not required Not required	None None	None None	Partial Partial	The iconv function in the GNU C Library (aka gilbc or libc6) 2.32 and earlier, when processing invalid multi-byte input sequences in IBM1364, IBM1371, IBM1388, IBM1390, and IBM1390, and IBM1390, and IBM1390 encodings, fails to advance the input state, which could lead to an infinite loop in applications, resulting in a denial of service, a different vulnerability from CVE-2016-10228. The GNU C Library (aka gilbc or libc6) before 2.32 could overflow an on-stack buffer during range reduction if an input to an 80-bit long double function contains a non-canonical bit pattern, a seen when passing a 0x5d4141414141411410000 value to sinl on x86 targets. This is related to sysdeps/ieee/754/lobl-96/e_rem_pio21c.
10 CVE-2020-6096 191 11 CVE-2020-1752 416	Exec Code Exec Code	01/04/2020 30/04/2020	04/03/2021 29/06/2021	6,8 None 3,7 None	Remote Medium Local High	Not required F Not required F		Partial Partial	Partial Partial	An exploitable signed comparison vulnerability exists in the ARMv7 memcpy() implementation of GNU glibc 2.30.9000. Calling memcpy () on ARMv7 targets that utilize the GNU glibc implementation) with a negative value for the 'num' parameter to memcpy(), this vulnerability could lead to undefined behavior such as writing to out-of-bounds memory and potentially remote code execution. Furthermore, tl A use-after-free vulnerability introduced in glibc upstream version 2.14 was found in the way the tilde expansion was carried out. Directory paths containing an initial tilde followed by a valid username were affected by this issue. A local attacker could exploit this flaw by creating a specially crafted path that, when processed by the glob function, would potentially lead to arbitrary code execution. This was fixed in version 2.32.
12 CVE-2020-1751 787 13 CVE-2019-101002 330	DoS Exec Code Bypass	17/04/2020 15/07/2019	09/07/2020 16/11/2020	5,9 None 5 None	Local Medium Remote Low	Not required F		Partial None	Complete None	An out-of-bounds write vulnerability was found in glibc before 2.31 when handling signal trampolines on PowerPC. Specifically, the backtrace function did not properly check the array bounds when storing the frame address, resulting in a denial of service or potential code execution. The highest threat from this vulnerability is to system availability. "DISPUTED "GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may quess the heap addresses of pitread_created thread_relation. The component is: qilbc. NOTE: the vendor's position is "ASLR bypass itself is not a vulnerability."
14 CVE-2019-101002 200 15 CVE-2019-1010023	Bypass +Info Exec Code	15/07/2019 15/07/2019	16/11/2020 16/11/2020	5 None 6,8 None	Remote Low Remote Medium	Not required F	Partial	None Partial	None Partial	"DISPUTED "GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass ASLR using cache of thread stack and heap. The component is: glibc. NOTE: Upstream comments indicale 'this is being treated as a non-security bug and no real threat." "DISPUTED "GNU Libc current is affected by: Re-mapping current loaded library with malicious ELF file. The impact is: In worst case attacker may evaluate privileges. The component is: libld. The attack vector is: Attacker sends 2 ELF files to victim and asks to run idd on it. Idd execute code. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
16 CVE-2019-101002 119	Overflow Bypass	15/07/2019 04/01/2021	10/06/2021 06/07/2021	7,5 None 7,1 None	Remote Low	Not required F	Partial	Partial	Partial	** DISPUTED ** GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass stack guard protection. The component is: nptl. The attack vector is: Exploit stack buffer overflow vulnerability to bypass stack guard. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
18 CVE-2019-19126 200	Bypass +Info	19/11/2019	21/07/2021	2,1 None	Remote Medium Local Low	Not required Not required	Partial	None None	Complete None	The iconv feature in the GNU C Library (aka glibc or libc6) through 2.32, when processing invalid multi-byte input sequences in the EUC-KR encoding, may have a buffer over-read. On the x86-64 architecture, the GNU C Library (aka glibc, or libc6) through 2.31 fails to ignore the LD_PREFER_IMAP_32BIT_EXEC environment variable during program execution after a security transition, allowing local attackers to restrict the possible mapping addresses for loaded libraries and thus bypass ASLR for a setuid program.
19 CVE-2019-9192 674 20 CVE-2019-9169 125		26/02/2019 26/02/2019	24/08/2020 09/07/2020	5 None 7,5 None	Remote Low Remote Low	Not required Not required	Partial	None Partial	Partial Partial	"DISPUTED" In the GNU C Library (aka gilbc or libc6) through 2.29, check_dst_limits_calc_pos_1 in posix/regexec.c has Uncontrolled Recursion, as demonstrated by '()\(\lambda{\text{VIII}}\)" in grep, a different issue than CVE-2018-20796. NOTE: the software maintainer disputes that this is a vulnerability because the behavior occurs only with a crafted pattern. In the GNU C Library (aka gilbc or libc6) through 2.29, proceed_next_node in posix/regexec.c has a heap-based buffer over-read via an attempted case-insensitive regular-expression match.
21 CVE-2019-7309 22 CVE-2019-6488 404		03/02/2019 18/01/2019	24/08/2020 13/06/2020	2,1 None 4,6 None	Local Low Local Low	Not required Not required	Partial	None Partial	Partial Partial	In the GNU C Library (aka gilbc or libc6) through 2.29, the memcmp function for the x32 architecture can incorrectly return zero (indicating that the inputs are equal) because the RDX most significant bit is mishandled. The string component in the GNU C Library (aka gilbc or libc6) through 2.28, when running on the x32 architecture, incorrectly attempts to use a 64-bit register for size_1 in assembly codes, which can lead to a segmentation fault or possibly unspecified other impact, as demonstrated by a crash inmemmove_avx_unaligned_erms in sysdeps/x86_64/multiarch/memmove-vec-unaligned-erms. Sturing a memcpy.
23 CVE-2018-100000 787 24 CVE-2018-20796 674	Exec Code	31/01/2018 26/02/2019	03/10/2019 05/11/2019	7,2 None 5 None	Local Low Remote Low	Not required Not required		None	Complete Partial	In gibc 2.26 and earlier there is confusion in the usage of getcwd() by realpath() which can be used to write before the destination buffer leading to a buffer underflow and potential code execution. In the GNU C Library (aka gilbc or libc6) through 2.29, check_dst_limits_calc_pos_1 in posix/regexec.c has Uncontrolled Recursion, as demonstrated by '(\(\begin{array}{c} 227\)\((\beta\)\((1)\)\(\beta\)[1]\((1)\)\(\beta\)[237\)\((\beta\)\)' in grep.
25 CVE-2018-19591 20 26 CVE-2018-11237 787	Overflow	04/12/2018 18/05/2018	09/07/2020 24/08/2020	5 None 4,6 None	Remote Low Local Low	Not required Not required		None Partial	Partial Partial	In the GNU C Library (aka gilbc or libcó) through 2.28, attempting to resolve a crafted hostname via getaddrinfo() leads to the allocation of a socket descriptor that is not closed. This is related to the if_nametoindex() function. An AVX-512-optimized implementation of the mempcpy function in the GNU C Library (aka gilbc or libcó) 2.27 and earlier may write data beyond the target buffer, leading to a buffer overfllow inmempcpy_avx512_no_vzeroupper.
27 CVE-2018-11236 787 28 CVE-2018-6551 787	Exec Code Overflow	18/05/2018 02/02/2018	24/08/2020 24/08/2020	7,5 None 7,5 None	Remote Low Remote Low	Not required F Not required F	Partial	Partial Partial	Partial Partial	stdilib/canonicalize.c in the GNU C Library (aka gilbc or libcó) 2.27 and earlier, when processing very long pathname arguments to the realpath function, could encounter an integer overflow on 32-bit architectures, leading to a stack-based buffer overflow and, potentially, arbitrary code execution. The malloc implementation in the GNU C Library (aka gilbc or libcó), from version 2.24 to 2.26 on powerpc, and only in version 2.26 on 1386, did not properly handle malloc calls with arguments close to SIZE_MAX and could return a pointer to a heap region that is smaller than requested, eventually leading to heap corruption.
29 CVE-2018-6485 787 30 CVE-2017-100040 119	Overflow Overflow	01/02/2018 01/02/2018	24/08/2020 04/04/2019	7,5 None 6,9 None	Remote Low Local Medium	Not required F	Partial	Partial	Partial Complete	An integer overflow in the implementation of the posix_memalign in memalign functions in the GNU C Library (also glibc or libcó) 2.26 and earlier could cause these functions to return a pointer to a heap area that is too small, potentially leading to heap corruption. A buffer overflow in glibc 2.5 (released on September 29, 2006) and can be triggered through the LD_LIBRARY_PATH environment variable. Please note that many versions of glibc are not vulnerable to this issue if patched for CVE-2017-1000366.
31 CVE-2017-100040 772 32 CVE-2017-100036 119	Exec Code Overflow	01/02/2018 01/02/2018 19/06/2017	03/10/2019 15/10/2020	7,2 None 7,2 None	Local Low Local Low	Not required (Complete	Complete	Complete Complete	A memory leak in gibz c 2.1 (released on May 24, 1999) can be reached and amplified through the LD_HWCAP_MASK environment variable. Please note that many versions of gibz care not vulnerable to this issue if patched for CVE-2017-1000366. gibz contains a vulnerability that allows specially careful LD_LIBRARY_PATH values to manipulate the heapth state of the careful distinguish and the prevent manipulation of stack and heap memory but these issues are not directly exploitable, as such they have not been given a CVE. This affects gibz 2.25 and earlier.
33 CVE-2017-1426 190 34 CVE-2017-16997 426	Overflow	05/12/2017 05/12/2017 18/12/2017	15/12/2017 15/10/2020	6,8 None 9,3 None	Remote Medium Remote Medium	Not required F	Partial	Partial	Partial Complete	gruc. contains a voluntearising that another speciatory contained a voluntearising charactery and execution. 35 CVE-2017-15804 119	Overflow	22/10/2017	20/06/2018	7,5 None	Remote Low	Not required (Partial	Partial	Partial	The glob function in glob.c in the GNU C Library (aka glibc or libcó) before 2.27 contains a buffer overflow during unescaping of user names with the – operator.
36 CVE-2017-15671 772 37 CVE-2017-15670 119	DoS Overflow	20/10/2017 20/10/2017	03/10/2019 20/06/2018	4,3 None 7,5 None	Remote Medium Remote Low	Not required F		None Partial	Partial Partial	The glob function in glob.c in the GNU C Library (aka glibc or libc6) before 2.27, when invoked with GLOB_TILDE, could skip freeing allocated memory when processing the - operator with a long user name, potentially leading to a denial of service (memory leak). The GNU C Library (aka glibc or libc6) before 2.27 contains an off-by-one error leading to a heap-based buffer overflow in the glob function in glob.c, related to the processing of home directories using the - operator followed by a long string.
38 CVE-2017-12133 416 39 CVE-2017-12132 770		07/09/2017 01/08/2017	09/07/2020 03/10/2019	4,3 None 4,3 None	Remote Medium Remote Medium	Not required Not required		Partial Partial	None None	Use-after-free vulnerability in the clntudp_call function in sumpc/clnt_udp.c in the GNU C Library (aka glibc or libc6) before 2.26 allows remote attackers to have unspecified impact via vectors related to error path. The DNS stub resolver in the GNU C Library (aka glibc or libc6) before version 2.26, when EDNS support is enabled, will solicit large UDP responses from name servers, potentially simplifying off-path DNS spoofing attacks due to IP fragmentation.
40 CVE-2017-8804 502 41 CVE-2016-10739 20	DoS	07/05/2017 21/01/2019	26/08/2020 06/08/2019	7,8 None 4,6 None	Remote Low Local Low	Not required Not required		None Partial	Complete Partial	** DISPUTED ** The xdr_bytes and xdr_string functions in the GNU C Library (aka gilbo or libcó) 2.25 mishandle failures of buffer deserialization, which allows remote attackers to cause a denial of service (virtual memory allocation, or memory consumption if an overcommit setting is not used) via a crafted UDP packet to port 111, a related issue to CVE-2017-8779. NOTE: [Information provided from upstream and references] In the GNU C Library (aka gilbo or libcó) through 2.28, the getaddrinfo function would successfully parse a string that contained an IPv4 address followed by whitespace and arbitrary characters, which could lead applications to incorrectly assume that it had parsed a valid string, without the possibility of embedded HTTP headers or other potentially dangerous substrings.
42 CVE-2016-10228 20 43 CVE-2016-6323 284	DoS DoS	02/03/2017 07/10/2016	25/02/2021 30/10/2018	4,3 None 5 None	Remote Medium Remote Low	Not required Not required		None None	Partial Partial	The iconv program in the GNU C Library (aka glibc or libcó) 2.31 and earlier, when invoked with multiple suffixes in the destination encoding (TRANSLATE or IGNORE) along with the -c option, enters an infinite loop when processing invalid multi-byte input sequences, leading to a denial of service. The makecontext function in the GNU C Library (aka glibc or libcó) before 2.25 creates execution contexts incompatible with the unwinder on ARM EABI (32-bit) platforms, which might allow context-dependent attackers to cause a denial of service (hang), as demonstrated by applications compiled using gccgo, related to backtrace generation.
44 CVE-2016-5417 399 45 CVE-2016-4429 787	DoS DoS Overflow	17/02/2017 10/06/2016	17/02/2017 20/07/2021	5 None 4,3 None	Remote Low Remote Medium	Not required Not required		None None	Partial Partial	Memory leak in the _res_vinit function in the IPv6 name server management code in libresolv in GNU C Library (aka glibc or libc6) before 2.24 allows remote attackers to cause a denial of service (memory consumption) by leveraging partial initialization of internal resolver data structures. Stack-based buffer overflow in the clutudg_call function in surropcicint_udp.c in the GNU C Library (aka glibc or libc6) allows remote servers to cause a denial of service (crash) or possibly unspecified other impact via a flood of crafted ICMP and UDP packets.
46 CVE-2016-3706 20 47 CVE-2016-3075 119	DoS Overflow DoS Overflow	10/06/2016 01/06/2016	29/10/2020 30/10/2018	5 None 5 None	Remote Low Remote Low	Not required Not required	None	None None	Partial Partial	Stack-based buffer overflow in the getaddrinfo function in sysdeps/posix/getaddrinfo c in the GNU C Library (aka glibc or libcó) allows remote attackers to cause a denial of service (crash) via vectors involving hostent conversion. NOTE: this vulnerability exists because of an incomplete fix for CVE-2013-4458. Stack-based buffer overflow in the rss. dns implementation of the getaddrinfo cin the getaddrinfo cin the GNU C Library (aka glibc) before 2.24 allows context-dependent attackers to cause a denial of service (stack consumption and application crash) via a long name.
48 CVE-2016-1234 119 49 CVE-2015-8985 19	DoS Overflow	01/06/2016 20/03/2017	01/09/2021 31/03/2020	5 None 4,3 None	Remote Low Remote Medium	Not required Not required	None	None None	Partial Partial	Stack-based buffer overflow in the glob implementation in GNU C Library (aka glibc) before 2.24, when GLOB_ALTDIRFUNC is used, allows context-dependent attackers to cause a denial of service (crash) via a long name. The pop_fail_stack function in the GNU C Library (aka glibc or libcé) allows context-dependent attackers to cause a denial of service (assertion failure and application crash) via vectors related to extended regular expression processing.
50 CVE-2015-8984 125	DoS Dos	20/03/2017	22/03/2017	4,3 None	Remote Medium	Not required 1	None	None	Partial	The finmatch function in the GNU C Library (aka glibc or libc6) before 2.22 might allow context-dependent attackers to cause a denial of service (application crash) via a malformed pattern, which triggers an out-of-bounds read.
52 CVE-2016-2179 399	DoS DoS	01/08/2016 16/09/2016	27/12/2019 27/12/2019	5 None 5 None	Remote Low Remote Low	Not required Not required	None	None None	Partial Partial	The TS_OBJ_print_bio function in cryptofts/ts_lib.c in the X.509 Public Key Infrastructure Time-Stamp Protocol (TSP) implementation in OpenSSL through 1.0.2h allows remote attackers to cause a denial of service (out-of-bounds read and application crash) via a crafted time-stamp file that is mishandled by the "openssl ts" command. The DTLS implementation in OpenSSL before 1.1.0 does not properly restrict the lifetime of queue entries associated with unused out-of-order messages, which allows remote attackers to cause a denial of service (memory consumption) by maintaining many crafted DTLS sessions simultaneously, related to d1_lib.c, statem_tibs.c, and statem_svr.c.
53 CVE-2016-2178 200 54 CVE-2016-2177 190	DoS Overflow	20/06/2016 20/06/2016	27/12/2019 27/12/2019	2,1 None 7,5 None	Local Low Remote Low	Not required F	Partial	None Partial	None Partial	The dsa_sign_setup function in cryptoldsaldsa_ossl.c in OpenSSL through 1.0.2h does not properly ensure the use of constant-time operations, which makes it easier for local users to discover a DSA private key via a timing side-channel attack. OpenSSL through 1.0.2h incorrectly uses pointer arithmetic for heap-buffer boundary checks, which might allow remote attackers to cause a denial of service (integer overflow and application crash) or possibly have unspecified other impact by leveraging unexpected malloc behavior, related to s3_srvr.c, ssl_sess.c, and 11_lib.c.
55 CVE-2016-2176 119 56 CVE-2016-2109 399	DoS Overflow +Info DoS	05/05/2016 05/05/2016	19/07/2018 19/07/2018	6,4 None 7,8 None	Remote Low Remote Low	Not required P Not required P		None None	Partial Complete	The X509_NAME_oneline function in cryptotox509/x509_obj.c in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2t and 1.0.2 before 1.0.2t allows remote attackers to obtain sensitive information from process stack memory or cause a denial of service (buffer over-read) via crafted EBCDIC ASN.1 data. The asn1_d2i_read_bio function in cryptot/asn1/a_d2i_fp.c in the ASN.1 BIO implementation in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2t allows remote attackers to cause a denial of service (memory consumption) via a short invalid encoding.
57 CVE-2016-2108 119 58 CVE-2016-2107 310	DoS Exec Code Overflow Mem. Corr.	05/05/2016 05/05/2016	05/01/2018 30/10/2018	10 None 2,6 None	Remote Low Remote High	Not required (Not required F		Complete None	Complete None	The ASN.1 implementation in OpenSSL before 1.0.1o and 1.0.2 before 1.0.1o and 1.0.2 before 1.0.2c allows remote attackers to execute arbitrary code or cause a denial of service (buffer underflow and memory corruption) via an ANY field in crafted serialized data, aka the "negative zero" issue. The AES-NI implementation in OpenSSL before 1.0.11 and 1.0.2 before 1.0.2h does not consider memory allocation during a certain padding check, which allows remote attackers to obtain sensitive cleartext information via a padding-oracle attack against an AES CBC session. NOTE: this vulnerability exists because of an incorrect fix for CVE-2013-0169.
59 CVE-2016-2106 189 60 CVE-2016-2105 189	DoS Overflow Mem. Corr. DoS Overflow Mem. Corr.	05/05/2016 05/05/2016	19/07/2018 21/02/2019	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	Partial Partial	Integer overflow in the EVP_EncryptUpdate function in cryptolevplevp_enc.c in OpenSSL before 1.0.2th and 1.0.2 before 1.0.2th allows remote attackers to cause a denial of service (heap memory corruption) via a large amount of data. Integer overflow in the EVP_EncodeUpdate function in cryptolevplencode.c in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2th allows remote attackers to cause a denial of service (heap memory corruption) via a large amount of binary data.
61 CVE-2016-0800 310 62 CVE-2016-0799 119	DoS Overflow	01/03/2016 03/03/2016	30/11/2018 05/01/2018	4,3 None 10 None	Remote Medium Remote Low	Not required F Not required C		None Complete	None Complete	The SSLv2 protocol, as used in OpenSSL before 1.0.1s and 1.0.2 before 1.0.1s and 1.0.2 before 1.0.2g and other products, requires a server to send a ServerVerify message before establishing that a client possesses certain plaintext RSA data, which makes it easier for remote attackers to decrypt TLS ciphentext data by leveraging a Bleichenbacher RSA padding oracle, aka a "DROWN" attack. The fmistr function in cryptolibiob_print.c in OpenSSL 1.0.1 before 1.0.1s and 1.0.2 before 1.0.2g improperly calculates string lengths, which allows remote attackers to cause a denial of service (overflow and out-of-bounds read) or possibly have unspecified other impact via a long string, as demonstrated by a large amount of ASN.1 data, a different vulnerability than CVE-2016-2842.
63 CVE-2016-0798 399 64 CVE-2016-0797	DoS DoS Overflow Mem. Corr.	03/03/2016 03/03/2016	21/11/2017 05/01/2018	7,8 None 5 None	Remote Low Remote Low	Not required Not required		None None	Complete Partial	Memory leak in the SRP_VBASE_get_by_user implementation in OpenSSL 1.0.1 before 1.0.1s and 1.0.2 before 1.0.1s and 1.0.2 before 1.0.2 gallows remote attackers to cause a denial of service (memory consumption) by providing an invalid username in a connection attempt, related to apps/s_server.c and crypto/srp/srp_vfy.c. Multiple integer overflows in OpenSSL 1.0.1 before 1.0.1s and 1.0.2 before 1.0.2 gallow remote attackers to cause a denial of service (heap memory corruption or NULL pointer dereference) or possibly have unspecified other impact via a long digit string that is mishandled by the (1) BN_dec2bn or (2) BN_hex2bn function, related to crypto/bn/bn_print.c.

Memory leak in d1_both.c in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8zb, 1.0.0 before 1.0.0n, and 1.0.1 before 1.0.0n, and 1.0.1 before 1.0.0in, an
117 CVE-2014-3506	399	DoS	13/08/2014	29/08/2017	5 None	Remote Low	Not required	None	None	Partial	d1_both.c in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8zb, 1.0.0 before 1.0.0n, and 1.0.1 before 1.0.0n, and 1.0.1 before 1.0.0i allows remote attackers to cause a denial of service (memory consumption) via crafted DTLS handshake messages that trigger memory allocations corresponding to large length values.
118 CVE-2014-3505 119 CVE-2014-3470	310	DoS DoS	13/08/2014 05/06/2014	07/01/2017 22/04/2019	5 None 4,3 None	Remote Low Remote Medium	Not required Not required		None None	Partial Partial	Double free vulnerability in d1_both.c in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8zb, 1.0.0 before 1.0.0n, and 1.0.1 before 1.0.0n, and 1.0.1 before 1.0.1i allows remote attackers to cause a denial of service (application crash) via crafted DTLS packets that trigger an error condition. The ssl3_send_client_key_exchange function in s3_clnt.c in OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m, and 1.0.1 before 1.0.1h, when an anonymous ECDH cipher suite is used, allows remote attackers to cause a denial of service (NULL pointer dereference and client crash) by triggering a NULL certificate value.
120 CVE-2014-0224 121 CVE-2014-0221	326 399	DoS	05/06/2014 05/06/2014	28/07/2020 22/04/2019	5,8 None 4,3 None	Remote Medium Remote Medium	Not required Not required		Partial None	None Partial	OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m, and 1.0.1 before 1.0.0m, and 1.0.1 before 1.0.1h does not properly restrict processing of ChangeCipherSpec messages, which allows man-in-the-middle altackers to trigger use of a zero-length master key in certain OpenSSL communications, and consequently hijack sessions or obtain sensitive information, via a crafted TLS handshake, aka the "CCS Injection" vulnerability. The dtls1_get_message_fragment function in d1_both.c in OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m, and 1.0.1 before 1.0.1h allows remote attackers to cause a denial of service (recursion and client crash) via a DTLS hello message in an invalid DTLS handshake.
122 CVE-2014-0198		DoS	06/05/2014	09/10/2018	4,3 None	Remote Medium	Not required	None	None	Partial	The do_ssl3_write function in s3_pkt.c in OpenSSL 1.x through 1.0.1g, when SSL_MODE_RELEASE_BUFFERS is enabled, does not properly manage a buffer pointer during certain recursive calls, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via vectors that trigger an alert condition.
123 CVE-2014-0195 124 CVE-2014-0160	119 119	DoS Exec Code Overflow 2 Overflow +Info	05/06/2014 07/04/2014	22/04/2019 28/07/2020	6,8 None 5 None	Remote Medium Remote Low	Not required Not required		Partial None	Partial None	The dits1_reassemble_fragment function in d1_both.c in OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m, and 1.0.1 before 1.0.0m and 1.0.1 before 1.0.0m and a long non-initial fragment. The (1) TLS and (2) DTLS implementations in OpenSSL 1.0.1 before 1.0.1g do not properly handle Heartbeat Extension packets, which allows remote attackers to obtain sensitive information from process memory via crafted packets that trigger a buffer over-read, as demonstrated by reading private keys, related to d1_both.c and 11_lib.c, aka the Heartbleed bug.
125 CVE-2014-0076 126 CVE-2013-6450	310 310	DoS	25/03/2014 01/01/2014	16/12/2017 09/10/2018	1,9 None 5,8 None	Local Medium Remote Medium	Not required Not required		None Partial	None Partial	The Montgomery ladder implementation in OpenSSL through 1.0.01 does not ensure that certain swap operations have a constant-time behavior, which makes it easier for local users to obtain ECDSA nonces via a FLUSH+RELOAD cache side-channel attack. The DTLS retransmission implementation in OpenSSL 1.0.0 before 1.0.01 does not properly and a constant-time behavior, which makes it easier for local users to obtain ECDSA nonces via a FLUSH+RELOAD cache side-channel attack. The DTLS retransmission implementation in OpenSSL 1.0.0 before 1.0.01 does not properly and and a constant-time behavior, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context, which might allow man-in-the-middle attackers to trigger the use of a different context.
127 CVE-2013-6449	310	DoS	23/12/2013	09/10/2018	4,3 None	Remote Medium	Not required	None	None	Partial	The ssl_get_algorithm2 function in ssl/s3_lib.c in OpenSSL before 1.0.2 obtains a certain version number from an incorrect data structure, which allows remote attackers to cause a denial of service (daemon crash) via crafted traffic from a TLS 1.2 client.
128 CVE-2013-4353 129 CVE-2013-0169	20 310	DoS	09/01/2014 08/02/2013	07/01/2017 09/10/2019	4,3 None 2,6 None	Remote Medium Remote High	Not required Not required		None None	Partial None	The ss13_lake_mac function in sslk3_both.c in OpenSSL 1.0.1 before 1.0.1f allows remote TLS servers to cause a denial of service (NULL pointer dereference and application crasth) via a crafted Next Protocol Negotiation record in a TLS handshake. The TLS protocol 1.1 and 1.2 and the DTLS protocol 1.0 and 1.2, as used in OpenSSL, OpenJDK, PolarSSL, and other products, do not properly consider timing side-channel attacks on a MAC check requirement during the processing of malformed CBC padding, which allows remote attackers to conduct distinguishing attacks and plaintext-recovery attacks via statistical analysis of timing data for crafted packets, aka the "Lucky Thirteen" issue.
130 CVE-2013-0166 131 CVE-2012-2686	310 310	DoS DoS	08/02/2013 08/02/2013	09/08/2018 09/08/2018	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	Partial Partial	OpenSSL before 0.9.8y, 1.0.0 before 1.0.0k, and 1.0.1 before 1.0.0k, and 1.0.1 before 1.0.0k, and 1.0.1 before 1.0.1d does not properly perform signature verification for OCSP responses, which allows remote OCSP servers to cause a denial of service (NULL pointer dereference and application crash) via an invalid key. cryptolevple_aes_cbc, hmac_sha1.c in the AES-NI functionality in the TLS 1.1 and 1.2 implementations in OpenSSL 1.0.1 before 1.0.1d allows remote attackers to cause a denial of service (application crash) via crafted CBC data.
132 CVE-2012-2333	189	DoS	14/05/2012	05/01/2018	6,8 None	Remote Medium	Not required	Partial	Partial	Partial	Integer underflow in OpenSSL before 0.9.8x, 1.0.0 before 1.0.0j, and 1.0.1 before 1.0.1c, when TLS 1.1, TLS 1.2, or DTLS is used with CBC encryption, allows remote attackers to cause a denial of service (buffer over-read) or possibly have unspecified other impact via a crafted TLS packet that is not properly handled during a certain explicit IV calculation.
133 CVE-2012-2131 134 CVE-2012-2110	189 119	DoS Overflow Mem. Corr. 1 DoS Overflow Mem. Corr.	24/04/2012 19/04/2012	05/01/2018 05/01/2018	7,5 None 7,5 None	Remote Low Remote Low	Not required Not required		Partial Partial	Partial Partial	Multiple integer signedness errors in cryptolbuffer/buffer.c in OpenSSL 0.9.8v allow remote attackers to conduct buffer overflow attacks, and cause a denial of service (memory corruption) or possibly have unspecified other impact, via crafted DER data, as demonstrated by an X.509 certificate or an RSA public key. NOTE: this vulnerability exists because of an incomplete fix for CVE-2012-2110. The asn1_d2i_read_bio function in cryptolbufasn1/a_d2i_fp.c in OpenSSL before 0.9.8v, 1.0.0 before 1.0.0i, and 1.0.1 before 1.0.1a does not properly interpret integer data, which allows remote attackers to conduct buffer overflow attacks, and cause a denial of service (memory corruption) or possibly have unspecified other impact, via crafted DER data, as demonstrated by an X.509 certificate or an RSA public key.
135 CVE-2012-1165 136 CVE-2012-0884	399 310	DoS	15/03/2012 13/03/2012	13/01/2018 10/01/2018	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	Partial None	The mime_param_cmp function in crypto/asn1/asn_cmime.c in OpenSSL before 0.9.8u and 1.x before 1.0.0h allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted S/MIME message, a different vulnerability than CVE-2006-7250. The implementation of Cryptographic Message Syntax (CMS) and PKCS \$7\$ in OpenSSL before 0.9.8u and 1.x before 1.0.0h does not properly restrict certain oracle behavior, which makes it easier for context-dependent attackers to decrypt data via a Million Message Attack (MMA) adaptive chosen ciphertext attack.
137 CVE-2012-0050	399	DoS	19/01/2012	23/08/2016	5 None	Remote Low	Not required	None	None	Partial	OpenSSL 0.9.8s and 1.0.0f does not properly support DTLS applications, which allows remote attackers to cause a denial of service (crash) via unspecified vectors related to an out-of-bounds read. NOTE: this vulnerability exists because of an incorrect fix for CVE-2011-4108.
138 CVE-2012-0027 139 CVE-2011-5095	399 310	DoS	06/01/2012 20/06/2012	26/03/2014 21/06/2012	5 None 4 None	Remote Low Remote High	Not required Not required		None Partial	Partial None	The GOST ENGINE in OpenSSL before 1.0.0f does not properly handle invalid parameters for the GOST block cipher, which allows remote attackers to cause a denial of service (daemon crash) via crafted data from a TLS client. The Diffie-Hellman key-exchange implementation in OpenSSL 0.9.8, when FIPS mode is enabled, does not properly validate a public parameter, which makes it easier for man-in-the-middle attackers to obtain the shared secret key by modifying network traffic, a related issue to CVE-2011-1923.
140 CVE-2011-4619 141 CVE-2011-4577	399 399	DoS DoS	06/01/2012 06/01/2012	23/08/2016 26/03/2014	5 None 4,3 None	Remote Low	Not required Not required		None None	Partial Partial	The Server Gated Cryptography (SGC) implementation in OpenSSL before 0.9.8s and 1.x before 1.0.0f does not properly handle handshake restarts, which allows remote attackers to cause a denial of service (CPU consumption) via unspecified vectors.
142 CVE-2011-4576	310	D03	06/01/2012	23/08/2016	5 None	Remote Medium Remote Low	Not required		None	None	OpenSSL before 0.9.8s and 1.x before 1.0.0f, when RFC 3779 support is enabled, allows remote attackers to cause a denial of service (assertion failure) via an X.509 certificate containing certificate extension data associated with (1) IP address blocks or (2) Autonomous System (AS) identifiers. The SSL 3.0 implementation in OpenSSL before 0.9.8s and 1.x before 1.0.0f does not properly initialize data structures for block cipher padding, which might allow remote attackers to obtain sensitive information by decrypting the padding data sent by an SSL peer.
143 CVE-2011-4354 144 CVE-2011-4109	310 399		27/01/2012 06/01/2012	06/11/2012 29/08/2017	5,8 None 9,3 None	Remote Medium Remote Medium	Not required Not required		Partial Complete	None Complete	crypto/bn/bn_nist.c in OpenSSL before 0.9.8h on 32-bit platforms, as used in stunnel and other products, in certain circumstances involving ECDH or ECDHE cipher suites, uses an incorrect modular reduction algorithm in its implementation of the P-256 and P-384 NIST elliptic curves, which allows remote attackers to obtain the private key of a TLS server via multiple handshake attempts. Double free vulnerability in OpenSSL 0.9.8 before 0.9.8s, when X509_V_FLAG_POLICY_CHECK is enabled, allows remote attackers to have an unspecified impact by triggering failure of a policy check.
145 CVE-2011-4108	310	D-C	06/01/2012	23/08/2016	4,3 None	Remote Medium	Not required	Partial	None	None	The DTLS implementation in OpenSSL before 0.9.8s and 1.x before 1.0.0f performs a MAC check only if certain padding is valid, which makes it easier for remote attackers to recover plaintext via a padding oracle attack.
146 CVE-2011-3210 147 CVE-2011-3207	399 264	DoS Bypass	22/09/2011 22/09/2011	26/03/2014 26/03/2014	5 None 5 None	Remote Low Remote Low	Not required Not required		None Partial	Partial None	The ephemeral ECDH ciphersuite functionality in OpenSSL 0.9.8 through 0.9.8r and 1.0.x before 1.0.0e does not ensure thread safety during processing of handshake messages from clients, which allows remote attackers to cause a denial of service (daemon crash) via out-of-order messages that violate the TLS protocol. crypto/x509/x509_vfy.c in OpenSSL 1.0.x before 1.0.0e does not initialize certain structure members, which makes it easier for remote attackers to bypass CRL validation by using a nextUpdate value corresponding to a time in the past.
148 CVE-2011-1945 149 CVE-2011-1473	310 264	DoS	31/05/2011 16/06/2012	06/06/2013 20/04/2021	2,6 None 5 None	Remote High Remote Low	Not required Not required		None None	None Partial	The elliptic curve cryptography (ECC) subsystem in OpenSSL 1.0.0d and earlier, when the Elliptic Curve Digital Signature Algorithm (ECDSA) is used for the ECDHE_ECDSA cipher suite, does not properly implement curves over binary fields, which makes it easier for context-dependent attackers to determine private keys via a timing attack and a lattice calculation. **DISPUTED **OpenSSL before 0.9.81, and 0.9.8m through 1.x, does not properly restrict client-initiated renegotiation within the SSL and TLS protocols, which might make it easier for remote attackers to cause a denial of service (CPU consumption) by performing many renegotiations within a single connection, a different vulnerability than CVE-2011-5094. NOTE: it can also be argued that it is the responsibility of server deployments, not a security library, to prevent or limit renegotiation within a single connection.
150 CVE-2011-0014	399	DoS +Info	19/02/2011	19/09/2017	5 None	Remote Low	Not required	None	None	Partial	ssl/t1_lib.c in OpenSSL 0.9.8h (through 0.9.8q and 1.0.0 through 1.0.0c allows remote attackers to cause a denial of service (crash), and possibly obtain sensitive information in applications that use OpenSSL, via a malformed ClientHello handshake message that triggers an out-of-bounds memory access, aka "OCSP stapling vulnerability."
151 CVE-2010-5298 152 CVE-2010-4252	362 287	DoS Bypass	14/04/2014 06/12/2010	10/10/2018 19/09/2017	4 None 7,5 None	Remote High Remote Low	Not required Not required		Partial Partial	Partial Partial	Race condition in the ssl3_read_bytes function in s3_kt.c in OpenSSL through 1.0.1g, when SSL_MODE_RELEASE_BUFFERS is enabled, allows remote attackers to inject data across sessions or cause a denial of service (use-after-free and parsing error) via an SSL connection in a multithreaded environment. OpenSSL before 1.0.0c, when J-PAKE is enabled, does not properly validate the public parameters in the J-PAKE protocol, which allows remote attackers to bypass the need for knowledge of the shared secret, and successfully authenticate, by sending crafted values in each round of the protocol.
153 CVE-2010-4180 154 CVE-2010-3864	362	Exec Code Overflow	06/12/2010 17/11/2010	19/09/2017 10/10/2018	4,3 None 7,6 None	Remote Medium Remote High	Not required Not required		Partial Complete	None Complete	OpenSSL before 0.9.8q, and 1.0.x before 1.0.0c, when SSL_OP_NETSCAPE_REUSE_CIPHER_CHANGE_BUG is enabled, does not properly prevent modification of the ciphersuite in the session cache, which allows remote attackers to force the downgrade to an unintended cipher via vectors involving sniffing network traffic to discover a session identifier. Multiple race conditions in sslitt_lib.c in OpenSSL 0.9.8f through 0.9.8o, 1.0.0, and 1.0.0a, when multi-threading and internal caching are enabled on a TLS server, might allow remote attackers to execute arbitrary code via client data that triggers a heap-based buffer overflow, related to (1) the TLS server name extension and (2) elliptic curve cryptography.
155 CVE-2010-2939	399	DoS Exec Code	17/08/2010	10/10/2018	4,3 None	Remote Medium	Not required	None	None	Partial	Double free vulnerability in the ss13_get_key_exchange function in the OpenSSL client (ssls3_cint.c) in OpenSSL 1.0.0a, 0.9.8, 0.9.7, and possibly other versions, when using ECDH, allows context-dependent attackers to cause a denial of service (crash) and possibly execute arbitrary code via a crafted private key with an invalid prime. NOTE: some sources refer to this as a use-after-free issue.
156 CVE-2010-1633 157 CVE-2010-0742	264 310	Bypass +Info Exec Code	03/06/2010 03/06/2010	26/03/2014 19/09/2017	6,4 None 7,5 None	Remote Low Remote Low	Not required Not required		Partial Partial	None Partial	RSA verification recovery in the EVP_PKEY_verify_recover function in OpenSSL 1.x before 1.0.0a, as used by pkeyutl and possibly other applications, returns uninitialized memory upon failure, which might allow context-dependent attackers to bypass intended key requirements or obtain sensitive information via unspecified vectors. NOTE: some of these details are obtained from third party information. The Cryptographic Message Syntax (CMS) implementation in cryptolcms/cms_asn1.c in OpenSSL before 0.9.8o and 1.x before 1.0.0a does not properly handle structures that contain OriginatorInfo, which allows context-dependent attackers, and possibly execute arbitrary code, via unspecified vectors.
158 CVE-2010-0740 159 CVE-2010-0433	20 20	DoS DoS	26/03/2010 05/03/2010	10/10/2018 10/10/2018	5 None 4,3 None	Remote Low Remote Medium	Not required Not required		None None	Partial Partial	The sst3_get_record function in sst/s_pkt.c in OpenSSL 0.9.8f through 0.9.8m allows remote attackers to cause a denial of service (crash) via a malformed record in a TLS connection that triggers a NULL pointer dereference, related to the minor version number. NOTE: some of these details are obtained from third party information. The kssl_keylab_is_available function in sst/kssl.c in OpenSSL before 0.9.8n, when Kerberos is enabled but Kerberos is enabled but Kerberos configuration files cannot be opened, does not check a certain return value, which allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via SSL cipher negotiation, as demonstrated by a chroot installation of Dovecot or stunnel without Kerberos configuration files inside the chroot.
160 CVE-2009-4355	399	DoS	14/01/2010	19/09/2017	5 None	Remote Low	Not required	None	None	Partial	Memory leak in the zilb_stateful_finish function in crypto/complic_zilib.c in OpenSSL 0.9.8l and earlier and 1.0.0 Beta through Beta 4 allows remote attackers to cause a denial of service (memory consumption) via vectors that trigger incorrect calls to the CRYPTO_cleanup_all_ex_data function, as demonstrated by use of SSLv3 and PHP with the Apache HTTP Server, a related issue to CVE-2008-1678.
161 CVE-2009-3555 162 CVE-2009-3245	310 20		09/11/2009 05/03/2010	05/02/2021 19/09/2017	5,8 None 10 None	Remote Medium Remote Low	Not required Not required		Partial Complete	Partial Complete	The TLS protocol, and the SSL protocol 3.0 and possibly earlier, as used in Microsoft Internet Information Services (IIS) 7.0, mod_ssi in the Apache HTTP Server 2.214 and earlier, Multiple Cisco products, and other products, does not properly associate renegotiation handshakes with an existing connection, which allows man-in-the-middle attackers to insert data into HTTPS sess OpenSSL before 0.9.8m, does not check for a NULL return value from bn_wexpand function calls in (1) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (2) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (4) crypto/bn/bn_div.c, (3) crypto/bn/bn_div.c, (4) crypto/bn/bn_div.c, (4) crypto/bn/bn_div.c, (4) crypto/bn/bn_div.c, (4) crypto/bn/bn_div.c, (5) crypto/bn/bn_div.c, (6) crypto/bn/bn_div.c, (7) crypto/bn/bn_div.c, (8) crypto/bn/bn_div.c, (7) crypto/bn/bn_div.c, (8) crypto/bn/bn_div.c, (8) crypto/bn/bn_div.c, (8) crypto/bn/bn_div.c, (9) crypto/bn/bn_div.c, (10) crypto/bn/bn_div.c, (10
163 CVE-2009-2409 164 CVE-2009-1387	310 399	DoS	30/07/2009 04/06/2009	10/10/2018 29/09/2017	5,1 None 5 None	Remote High Remote Low	Not required Not required		Partial None	Partial Partial	The Network Security Services (NSS) library Services (NSS) library before 3.12.3, as used in Firefox: GnuTLS before 2.6.4 and 2.7.4; OpenSSL 0.9.8 through 0.9.8k; and other products support MD2 with X.509 certificates, which might allow remote attackers to spoof certificates by using MD2 design flaws to generate a hash collision in less than brute-force time. NOTE: the scope of this issue is currently limited because the amount of computation required is still large. The dists_retrieve_buffered_fragment function in solids_both.c in OpenSSL before 1.0.0 Beta 2 allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via an out-of-sequence DTLS handshake message, related to a "fragment bug."
165 CVE-2009-1386	333	DoS	04/06/2009	29/09/2017	5 None	Remote Low	Not required	None	None	Partial	ssl/s3_pkt.c in OpenSSL before 0.9.8i allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via a DTLS ChangeCipherSpec packet that occurs before ClientHello.
166 CVE-2009-1379 167 CVE-2009-1378	399 399	DoS DoS	19/05/2009 19/05/2009	29/09/2017 29/09/2017	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	Partial Partial	Use-after-free vulnerability in the dtls1_retrieve_buffered_fragment function in sslid1_both.c in OpenSSL 1.0.0 Beta 2 allows remote attackers to cause a denial of service (openssl s_client crash) and possibly have unspecified other impact via a DTLS packet, as demonstrated by a packet from a server that uses a crafted server certificate. Multiple memory leaks in the dtls1_process_out_of_seq_message function in sslid1_both.c in OpenSSL 0.9.8k and earlier 0.9.8 versions allow remote attackers to cause a denial of service (memory consumption) via DTLS records that (1) are duplicates or (2) have sequence numbers, aka "DTLS fragment handling memory leak."
168 CVE-2009-1377 169 CVE-2009-0789	119 189	DoS Overflow DoS	19/05/2009 27/03/2009	29/09/2017 17/08/2017	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	Partial Partial	The dtls1_buffer_record function in sslid1_pkt.c in OpenSSL 0.9.8k and earlier 0.9.8 versions allows remote attackers to cause a denial of service (memory consumption) via a large series of "future epoch" DTLS records that are buffered in a queue, aka "DTLS record buffer limitation bug." OpenSSL before 0.9.8k on WIN64 and certain other platforms does not properly handle a mailformed ASN.1 structure, which allows remote attackers to cause a denial of service (invalid memory access and application crash) by placing this structure in the public key.
170 CVE-2009-0653	287	503	20/02/2009	25/06/2009	7,5 None	Remote Low	Not required		Partial	Partial	OpenSSL, probably 0.9.6, does not verify the Basic Constraints for an intermediate CA-signed certificate, which allows remote attackers to spoof the certificates of trusted sites via a man-in-the-middle attack, a related issue to CVE-2002-0970.
171 CVE-2009-0591 172 CVE-2009-0590	287 119	DoS Overflow	27/03/2009 27/03/2009	17/08/2017 03/11/2020	2,6 None 5 None	Remote High Remote Low	Not required Not required		Partial None	None Partial	The CMS_verify function in OpenSSL 0.9.8h through 0.9.8j, when CMS is enabled, does not properly handle errors associated with malformed signed attributes, which allows remote attackers to repudiate a signature that originally appeared to be valid but was actually invalid. The ASN1_STRING_print_ex function in OpenSSL 0.9.8h allows remote attackers to cause a denial of service (invalid memory access and application crash) via vectors that trigger printing of a (1) BMPString or (2) UniversalString with an invalid encoded length.
173 CVE-2008-7270 174 CVE-2008-5077	310 20	Rypass	06/12/2010 07/01/2009	06/04/2012 11/10/2018	4,3 None 5,8 None	Remote Medium Remote Medium	Not required Not required		Partial Partial	None Partial	OpenSSL before 0.9.8j, when SSL_OP_NETSCAPE_REUSE_CIPHER_CHANGE_BUG is enabled, does not prevent modification of the ciphersulte in the session cache, which allows remote attackers to force the use of a disabled cipher via vectors involving sniffing network traffic to discover a session identifier, a different vulnerability than CVE-2010-4180. OpenSSL 0.9.8i and earlier does not properly check the return value from the EVP_VerifyFinal function, which allows remote attackers to bypass validation of the certificate chain via a malformed SSL/TLS signature for DSA and ECDSA keys.
175 CVE-2008-1678	399	Bypass DoS	10/07/2008	29/09/2017	5 None	Remote Low	Not required	None	None	Partial	Memory leak in the zilb_stateful_init function in cryptolcomplc_zilb.c in libssl in OpenSSL 0.9.8f through 0.9.8h allows remote attackers to cause a denial of service (memory consumption) via multiple calls, as demonstrated by initial SSL client handshakes to the Apache HTTP Server mod_ssl that specify a compression algorithm.
176 CVE-2008-0891 177 CVE-2007-5502	189 310	DoS Bypass	29/05/2008 01/12/2007	08/08/2017 29/07/2017	4,3 None 6,4 None	Remote Medium Remote Low	Not required Not required		None Partial	Partial None	Double free vulnerability in OpenSSL 0.9.8f and 0.9.8g, when the TLS server name extensions are enabled, allows remote attackers to cause a denial of service (crash) via a malformed Client Hello packet. NOTE: some of these details are obtained from third party information. The PRNG implementation for the OpenSSL FIPS Object Module 1.1.1 does not perform auto-seeding during the FIPS self-lest, which generates random data that is more predictable than expected and makes it easier for attackers to bypass protection mechanisms that rely on the randomness.
178 CVE-2007-5135	189 189	Exec Code	27/09/2007	15/10/2018	6,8 None	Remote Medium	Not required	Partial	Partial	Partial	Off-by-one error in the SSL_get_shared_ciphers function in OpenSSL 0.9.7 up to 0.9.71, and 0.9.8 up to 0.9.8f, might allow remote attackers to execute arbitrary code via a crafted packet that triggers a one-byte buffer underflow. NOTE: this issue was introduced as a result of a fix for CVE-2006-3738. As of 20071012, it is unknown whether code execution is possible.
179 CVE-2007-4995 180 CVE-2007-3108	189	Exec Code	13/10/2007 08/08/2007	15/10/2018 16/10/2018	9,3 None 1,2 None	Remote Medium Local High	Not required Not required		None	Complete None	Off-by-one error in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8f allows remote attackers to execute arbitrary code via unspecified vectors. The BN_from_montgomery function in cryptorbn/bn_mont.c in OpenSSL 0.9.8e and earlier does not properly perform Montgomery multiplication, which might allow local users to conduct a side-channel attack and retrieve RSA private keys.
181 CVE-2006-7250 182 CVE-2006-4343	476	DoS DoS	29/02/2012 28/09/2006	06/01/2018 17/10/2018	5 None 4,3 None	Remote Low Remote Medium	Not required Not required		None None	Partial Partial	The mime_hdr_cmp function in cryptolassn1/asn_mime.c in OpenSSL 0.9.8t and earlier allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted S/MIME message. The get_server_helio function in the SSLv2 client code in OpenSSL 0.9.7 before 0.9.7l, 0.9.8 before 0.9.8d, and earlier versions allows remote servers to cause a denial of service (client crash) via unknown vectors that trigger a null pointer dereference.
183 CVE-2006-4339	310		05/09/2006	17/10/2018	4,3 None	Remote Medium	Not required	Partial	None	None	OpenSSL before 0.9.7, 0.9.7 before 0.9.7k, and 0.9.8 before 0.9.8c, when using an RSA key with exponent 3, removes PKCS-1 padding before generating a hash, which allows remote attackers to forge a PKCS #1 v1.5 signature that is signed by that RSA key and prevents OpenSSL from correctly verifying X.509 and other certificates that use PKCS #1.
184 CVE-2006-3738 185 CVE-2006-2940	119 399	Overflow DoS	28/09/2006 28/09/2006	17/10/2018 18/10/2018	10 None 7,8 None	Remote Low Remote Low	Not required Not required		None None	Complete Complete	Buffer overflow in the SSL_get_shared_ciphers function in OpenSSL 0.9.7 before 0.9.71, 0.9.8 before 0.9.8d, and earlier versions has unspecified impact and remote attack vectors involving a long list of ciphers. OpenSSL 0.9.7 before 0.9.71, 0.9.8 before 0.9.8d, and earlier versions allows attackers to cause a denial of service (CPU consumption) via parasitic public keys with large (1) "public modulus" values in X.509 certificates that require extra time to process when using RSA signature verification.
	399	DoS	28/09/2006	18/10/2018	7,8 None 5 None	Remote Low Remote Low	Not required Not required		None Partial	Complete None	OpenSSL 0.9.7 before 0.9.71 and 0.9.8 before 0.9.71 and 0.9.8 before 0.9.8d allows remote attackers to cause a denial of service (infinite loop and memory consumption) via malformed ASN.1 structures that trigger an improperty handled error condition. The SSL/TLS server implementation in OpenSSL 0.9.7 before 0.9.7h and 0.9.8 before 0.9.7h and 0.9.8 before 0.9.8a, when using the SSL_OP_MSIE_SSLV2_RSA_PADDING option, disables a verification step that is required for preventing protocol version rollback attacks, which allows remote attackers to force a client and server to use a weaker protocol than needed via a man-in-the-middle attack.
186 CVE-2006-2937 187 CVE-2005-2969				03/05/2018					Partial	None	The default configuration on OpenSSL before 0.9.8 uses MD5 for creating message digests instead of a more cryptographically strong algorithm, which makes it easier for remote attackers to forge certificates with a valid certificate authority signature.
187 CVE-2005-2969 188 CVE-2005-2946	310		18/10/2005 16/09/2005	03/05/2018 07/01/2009	5 None	Remote Low	Not required			Partial	
187 CVE-2005-2969	310		18/10/2005					Partial	Partial Partial	None	The design of Advanced Encryption Standard (AES), aka Rijndael, allows remote attackers to recover AES keys via timing attacks on S-box lookups, which are difficult to perform in constant time in AES implementations. The der_chop script in the openssl package in Trustix Secure Linux 1.5 through 2.1 and other operating systems allows local users to overwrite files via a symlink attack on temporary files.
187 CVE-2005-2969 188 CVE-2005-2946 189 CVE-2005-1797 190 CVE-2004-0975 191 CVE-2003-0545	310 119	DoS Exec Code Overflow DoS	18/10/2005 16/09/2005 26/05/2005 09/02/2005 17/11/2003	07/01/2009 05/09/2008 11/10/2017 03/05/2018	5 None 5,1 None 2,1 None 10 None	Remote Low Remote High Local Low Remote Low	Not required Not required Not required Not required	Partial None Complete	Partial Partial Complete	None Complete	The der_chop script in the openssI package in Trustix Secure Linux 1.5 through 2.1 and other operating systems allows local users to overwrite files via a symlink attack on temporary files. Double free vulnerability in OpenSSL 0.9.7 allows remote attackers to cause a denial of service (crash) and possibly execute arbitrary code via an SSL client certificate with a certain invalid ASN.1 encoding.
187 CVE-2005-2969 188 CVE-2005-2946 189 CVE-2005-1797 190 CVE-2004-0975 191 CVE-2003-0545 192 CVE-2003-0544 193 CVE-2003-0543		DoS Exec Code Overflow DoS DoS Overflow	18/10/2005 16/09/2005 26/05/2005 09/02/2005 17/11/2003 17/11/2003	07/01/2009 05/09/2008 11/10/2017 03/05/2018 03/05/2018 03/05/2018	5 None 5,1 None 2,1 None 10 None 5 None 5 None	Remote Low Remote High Local Low Remote Low Remote Low Remote Low	Not required Not required Not required Not required Not required Not required	Partial None Complete None None	Partial Partial Complete None None	None Complete Partial Partial	The der_chop script in the opensst package in Trustix Secure Linux 1.5 through 2.1 and other operating systems allows local users to overwrite files via a symlink attack on temporary files. Double free vulnerability in OpenSSL 0.9.7 allows remote attackers to cause a denial of service (crash) and possibly execute arbitrary code via an SSL client certificate with a certain invalid ASN.1 encoding. OpenSSL 0.9.6 and 0.9.7 does not properly track the number of characters in certain ASN.1 inputs, which allows remote attackers to cause a denial of service (crash) via an SSL client certificate that causes OpenSSL to read past the end of a buffer when the long form is used. Integer overflow in OpenSSL 0.9.6 and 0.9.7 allows remote attackers to cause a denial of service (crash) via an SSL client certificate with certain ASN.1 tag values.

38 CVE-2008-5079	399	DoS	09/12/2008	11/10/2018	4,9 None	Local Low	Not required	None	None	Complete	net/attm/svc.c in the ATM subsystem in the Linux kernel 2.6.27.8 and earlier allows local users to cause a denial of service (kernel infinite loop) by making two calls to svc_listen for the same socket, and then reading a /proc/net/atm/"vc file, related to corruption of the vcc table.
39 CVE-2008-5029		DoS	10/11/2008	11/10/2018	4,9 None	Local Low	Not required	None	None	Complete	The _scm_destroy function in net/core/scm.c in the Linux kernel 2.6.27.4, 2.6.26, and earlier makes indirect recursive calls to itself through calls to the fput function, which allows local users to cause a denial of service (panic) via vectors related to sending an SCM_RIGHTS message through a UNIX domain socket and closing file descriptors.
40 CVE-2008-5025 41 CVE-2008-4933	119 119	DoS Overflow Mem. Corr. DoS Overflow Mem. Corr.	17/11/2008 05/11/2008	29/09/2017 29/09/2017	7,8 None 7,8 None	Remote Low Remote Low	Not required Not required		None None	Complete Complete	Stack-based buffer overflow in the hfs_cat_find_brec function in fshfs/catalog.c in the Linux kernel before 2.6.28+rc1 allows attackers to cause a denial of service (memory corruption or system crash) via an hfs filesystem image with an invalid catalog namelength field, a related issue to CVE-2008-4933. Buffer overflow in the hfsplus_find_cat function in fshfsplus/catalog.c in the Linux kernel before 2.6.28+rc1 allows attackers to cause a denial of service (memory corruption or system crash) via an hfsplus filesystem image with an invalid catalog namelength field, related to the hfsplus_cat_build_key_uni function.
42 CVE-2008-4618	20	DoS	21/10/2008	19/03/2012	7,8 None	Remote Low	Not required	None	None	Complete	The Stream Control Transmission Protocol (sctp) implementation in the Linux kernel before 2.6.27 does not properly handle a protocol violation in which a parameter has an invalid length, which allows attackers to cause a denial of service (panic) via unspecified vectors, related to sctp_s_violation_parameter, sctp_s_abort_violation, and incorrect data types in function calls.
43 CVE-2008-4576 44 CVE-2008-4554	287 264	DoS Bypass	15/10/2008 15/10/2008	29/09/2017 29/09/2017	7,8 None 4,6 None	Remote Low Local Low	Not required Not required		None Partial	Complete Partial	sctp in Linux kernel before 2.6.25.18 allows remote attackers to cause a denial of service (OOPS) via an INIT-ACK that states the peer does not support AUTH, which causes the sctp_process_init function to clean up active transports and triggers the OOPS when the T1-Init timer expires. The do_splice_from function in fs/splice c in the Linux kernel before 2.6.27 does not reject file descriptors that have the O_APPEND flag set, which allows local users to bypass append mode and make arbitrary changes to other locations in the file.
45 CVE-2008-4445	200	Буразз	06/10/2008	30/10/2012	4,7 None	Local Medium	Not required		None	None	The sctp_auth_ep_set_hmacs function in net/sctp/auth_c in the Stream Control Transmission Protocol (sctp) implementation in the Linux kernel before 2.6.26.4, when the SCTP_AUTH_HMAC_ID_MAX, which allows local users to obtain sensitive information via a crafted SCTP_HMAC_IDENT IOCTL request involving the sctp_getsockopt function, a different vulnerability than CVE-200
46 CVE-2008-4395 47 CVE-2008-4307	119 362	Exec Code Overflow DoS	06/11/2008 13/01/2009	08/08/2017 11/10/2018	8,3 None 4 None	Local Net\ Low Local High		Complete None	Complete None	Complete Complete	Multiple buffer overflows in the ndiswrapper module 1.53 for the Linux kernel 2.6 allow remote attackers to execute arbitrary code by sending packets over a local wireless network that specify long ESSIDs. Race condition in the do_sellk function in fs/nfs/file.c in the Linux kernel before 2.6.26 allows local users to cause a denial of service (crash) via vectors resulting in an interrupted RPC call that leads to a stray FL_POSIX lock, related to improper handling of a race between fcmtl and close in the EINTR case.
48 CVE-2008-4302	399	DoS	29/09/2008	29/09/2017	4,9 None	Local Low	Not required		None	Complete	fs/splice_c in the splice subsystem in the Linux kernel before 2.6.22.2 does not properly handle a failure of the add_to_page_cache_fru function, and subsequently attempts to unlock a page that was not locked, which allows local users to cause a denial of service (kernel BUG and system crash), as demonstrated by the fio I/O tool.
49 CVE-2008-4210	264		29/09/2008	29/09/2017	4,6 None	Local Low	Not required		Partial	Partial	fs/open.c in the Linux kernel before 2.6.22 does not properly strip setuid and setgid bits when there is a write to a file, which allows local users to gain the privileges of a different group, and obtain sensitive information or possibly have unspecified other impact, by creating an executable file in a setgid directory through the (1) truncate or (2) ftruncate function in conjunction with memory-mapped I/O.
50 CVE-2008-4113 51 CVE-2008-3833	200 264		16/09/2008 03/10/2008	11/10/2018 29/09/2017	4,7 None 4,9 None	Local Medium Local Low	Not required Not required	Complete Complete	None None	None None	The sctp_getsockopt_hmac_ident function in net/sctp/socket.c in the Stream Control Transmission Protocol (sctp) implementation in the Linux kernel before 2.6.26.4, when the SCTP_AUTH extension is enabled, relies on an untrusted length value to limit copying of data from kernel memony, which allows local users to obtain sensitive information via a crafted SCTP_HIMAC_IDENT IOCTL request involving the sctp_getsockopt function. The generic_file_splice_write function in fs/splice.c in the Linux kernel before 2.6.19 does not properly strip setuid and setgid bits when there is a write to a file, which allows local users to gain the privileges of a different group, and obtain sensitive information or possibly have unspecified other impact, by splicing into an inode in order to create an executable file in a setgid directory, a different underability than CVE-2008-4210.
52 CVE-2008-3527	264	DoS +Priv	05/11/2008	29/09/2017	4,6 None	Local Low	Not required	Partial	Partial	Partial	arch/1386/kemel/sysenter.c in the Virtual Dynamic Shared Objects (vDSO) implementation in the Linux kernel before 2.6.21 does not properly check boundaries, which allows local users to gain privileges or cause a denial of service via unspecified vectors, related to the install_special_mapping, syscall, and syscall32_nopage functions.
53 CVE-2007-4567 54 CVE-2007-3740	20 264	DoS	21/12/2007 14/09/2007	03/10/2018 29/09/2017	7,8 None 4,4 None	Remote Low Local Medium	Not required Not required	None Partial	None Partial	Complete Partial	The ipv6_hop_jumbo function in net/fipv6/exthdrs.c in the Linux kernel before 2.6.22 does not properly validate the hop-by-hop IPv6 extended header, which allows remote attackers to cause a denial of service (NULL pointer dereference and kernel panic) via a crafted IPv6 packet. The CIFS filesystem in the Linux kernel before 2.6.22, when Unix extension support is enabled, does not honor the umask of a process, which allows local users to gain privileges.

CVE ID CV 1 CVE-2019-15847	WE ID # de Explorações 331	s Tipo(s) de vulnerabilidades	Data de publicação Data o 02/09/2019	de atualização Pont 17/09/2020	ntuação Nivel de Ace 5 None	cesso Ganho Acesse Complexidade Remote Low	Autenticação Not required		Integração None	Disponibilidade None	The POWER9 backend in GNU Compiler Collection (GCC) before version 10 could optimize multiple calls of thebuiltin_darm intrinsic into a single call, thus reducing the entropy of the random number generator. This occurred because a volatile operation was not specified. For example, within a single execution of a program, the output of everybuiltin_darm() call may be the same.
2 CVE-2018-12886	209	Overflow Bypass	22/05/2019	24/08/2020	6,8 None	Remote Medium		Partial	Partial	Partial	stack_protect_prologue in cfgexpand.c and stack_protect-epilogue in function.c in GNU Compiler Collection (GCC) 4.1 through 8 (under certain circumstances) generate instruction sequences when targeting ARM targets that spill the address of the stack-protector-strong, and -fstack-protector-strong, and -fstack-protector-explicit against stack overflow by controlling what the stack canary is compared agains
3 CVE-2017-11671 4 CVE-2015-5276	338 200		26/07/2017 17/11/2015	12/04/2018 12/02/2019	2,1 None 5 None	Local Low Remote Low	Not required Not required		None None	None None	Under certain circumstances, the ix86_expand_builtin function in i386.c in GNU Compiler Collection (GCC) version 4.6, 4.7, 4.8, 4.9, 5 before 5.5, and 6 before 6.4 will generate instruction sequences that clobber the extatus flag of the RDRAND and RDSEED intrinsics before it can be read, potentially causing failures of these instructions to go unreported. This could potentially lead to less randomness in random number generation. The std:random_device class in libstdc++ in the GNU Compiler Collection (aka GCC) before 4.9.4 does not properly handle short reads from blocking sources, which makes it easier for context-dependent attackers to predict the random values via unspecified vectors.
5 CVE-2008-1685	119	Overflow	06/04/2008	08/08/2017	6,8 None	Remote Medium	Not required		Partial	Partial	"DISPUTED " gcc 4.2.0 through 4.3.0 in GNU Compiler Collection, when casts are not used, considers the sum of a pointer and an int to be greater than or equal to the pointer, which might lead to removal of length testing code that was intended as a protection mechanism against integer overflow altacks, and provide no diagnostic message about this removal. NOTE: the vendor has determined that this compiler behavior is correct according to section 6.5.6 of the C99 s
6 CVE-2008-1367 7 CVE-2006-1902	399 119	Mem. Corr. Overflow	17/03/2008 20/04/2006	29/09/2017 18/10/2018	7,5 None 2,1 None	Remote Low Local Low	Not required		Partial Partial	Partial None	gcc 4.3 xt does not generate a cld instruction while compiling functions used for string manipulation such as memcpy and memmove on x86 and i386, which can prevent the direction flag (DF) from being reset in violation of ABI conventions and cause data to be copied in the urmout who context-dependent attackers to trigger memory corruption. NOTE: this issue was originally reported for CPU consumption in SBCL.
8 CVE-2002-2439	190	Overflow	23/10/2019	31/10/2019	4,6 None	Local Low	Not required Not required		Partial	Partial	fold_binary in fold-const.c in GNU Compiler Collection (gcc) 4.1 improperly handles pointer overflow when folding a certain expr comparison to a corresponding offset comparison in cases other than EQ_EXPR and NE_EXPR, which might introduce buffer overflow vulnerabilities into applications that could be exploited by context-dependent attackers.NOTE: the vendor states that the essence of the issue is "not correctly interpreting an offset to a pointer as a signed value." Integer overflow in the new[] operator in gcc before 4.8.0 allows attackers to have unspecified impacts.
9 CVE-2000-1219		Overflow	01/11/2000	05/09/2008	7,5 None	Remote Low	Not required	Partial	Partial	Partial	The -ftrapv compiler option in gcc and g++ 3.3.3 and earlier does not handle all types of integer overflows, which may leave applications vulnerabilities related to overflows.

1 CVE-2021-38604	476		12/08/2021	07/10/2021	5 None	Remote Low	Not required		None	Partial	In librt in the GNU C Library (aka glibc) through 2.34, sysdeps/unix/syswllinux/mq_notify.c mishandles certain NOTIFY_REMOVED data, leading to a NULL pointer dereference. NOTE: this vulnerability was introduced as a side effect of the CVE-2021-33574 fix.
2 CVE-2021-35942 3 CVE-2021-33574	190 416	DoS DoS	22/07/2021 25/05/2021	21/09/2021 07/07/2021	6,4 None 7,5 None	Remote Low Remote Low	Not required Not required		None Partial	Partial Partial	The wordexp function in the GNU C Library (aka glibc) through 2.33 may crash or read arbitrary memory in parse_param (in posix/wordexp.c) when called with an untrusted, crafted pattern, potentially resulting in a denial of service or disclosure of information. This occurs because atoi was used but strtoul should have been used to ensure correct calculations. The mq_notify function in the GNU C Library (aka glibc) versions 2.32 and 2.33 has a use-after-free. It may use the notification thread attributes object (passed through its struct sigevent parameter) after it has been freed by the caller, leading to a denial of service (application crash) or possibly unspecified other impact.
4 CVE-2021-27645	415	DoS	24/02/2021	06/07/2021	1,9 None	Local Medium	Not required		None	Partial	The nameserver caching daemon (nscd) in the GNU C Library (aka glibc or libcé) 2.29 through 2.33, when processing a request for netgroup lookup, may crash due to a double-free, potentially resulting in degraded service or Denial of Service on the local system. This is related to netgroupcache.c.
5 CVE-2021-3326 6 CVE-2020-29573	617 787	DoS Overflow	27/01/2021 06/12/2020	06/07/2021 26/01/2021	5 None 5 None	Remote Low Remote Low	Not required		None None	Partial Partial	The iconv function in the GNU C Library (aka glibc or libcó) 2.32 and earlier, when processing invalid input sequences in the ISO-2022-IP-3 encoding, fails an assertion in the code path and aborts the program, potentially resulting in a denial of service.
7 CVE-2020-29562	617	DoS	04/12/2020	19/03/2021	2,1 None	Remote High	Not required ???	None	None	Partial	sysdeps/1386/ldbl2mpn.c in the GNU C Library (aka glibc or libc6) before 2.23 on x86 targets has a stack-based buffer overflow if the input to any of the printf family of functions is an 80-bit long double with a non-canonical bit pattern, as seen when passing a \xxi00\xxi04\xxi00\
8 CVE-2020-27618	835	DoS	26/02/2021	06/07/2021	2,1 None	Local Low	Not required		None	Partial	The iconv function in the GNU C Library (aka gilbc or libcó) 2.32 and earlier, when processing invalid multi-byte input sequences in IBM1364, IBM1371, IBM1388, IBM1390, and IBM1399 encodings, fails to advance the input state, which could lead to an infinite loop in applications, resulting in a denial of service, a different vulnerability from CVE-2016-10228.
9 CVE-2020-10029 10 CVE-2020-6096	119 191	Overflow Exec Code	04/03/2020 01/04/2020	21/07/2021 04/03/2021	2,1 None 6,8 None	Local Low Remote Medium	Not required Not required		None Partial	Partial Partial	The GNU C Library (aka glibc or libc6) before 2.32 could overflow an on-stack buffer during range reduction if an input to an 80-bit long double function contains a non-canonical bit pattern, a seen when passing a 0x5d414141414141410000 value to sinl on x86 targets. This is related to sysdeps/leee/754/ldbl-96/le_rem_pio2/Lc. An exploitable signed comparison vulnerability exists in the ARMv7 memcpy() implementation of GNU glibc 2.30.9000. Calling memcpy() (or ARMv7 targets that utilize the GNU glibc implementation) with a negative value for the 'num' parameter to memcpy(), this vulnerability could lead to undefined behavior such as writing to out-of-bounds memory and potentially remote code execution. Furthermore, tl
11 CVE-2020-1752	416	Exec Code Exec Code	30/04/2020	29/06/2021	3,7 None	Local High	Not required Not required		Partial	Partial	An exploirable signed comparison vulnerability introduced in glibc upstream value in the activity memory and potentially remote code execution. Furthermore, it as eafter-free vulnerability introduced in glibc upstream version 2.14 was found in the way the tilde expansion was carried out. Directory paths containing an initial tilde followed by a valid username were affected by this issue. A local attacker could exploit this flaw by creating a specially crafted path that, when processed by the glob function, would potentially lead to arbitrary code execution. This was fixed in version 2.32.
12 CVE-2020-1751	787	DoS Exec Code	17/04/2020	09/07/2020	5,9 None	Local Medium	Not required	Partial	Partial	Complete	An out-of-bounds write vulnerability was found in glibc before 2.31 when handling signal trampolines on PowerPC. Specifically, the backtrace function did not properly check the array bounds when storing the frame address, resulting in a denial of service or potential code execution. The highest threat from this vulnerability is to system availability.
13 CVE-2019-101002 14 CVE-2019-101002	330 200	Bypass Bypass +Info	15/07/2019 15/07/2019	16/11/2020 16/11/2020	5 None 5 None	Remote Low Remote Low	Not required Not required		None None	None None	** DISPUTED ** GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may guess the heap addresses of pithread_created thread. The component is: glibc. NOTE: the vendor's position is *ASLR bypass itself is not a vulnerability." ** DISPUTED ** GNU Libc current is affected by: Mitigation bypass. The impact is: Attacker may bypass ASLR using cache of thread stack and heap. The component is: glibc. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
15 CVE-2019-1010023		Exec Code	15/07/2019	16/11/2020	6,8 None	Remote Medium	Not required	Partial	Partial	Partial	** DISPUTED ** GNU Libc current is affected by: Re-mapping current loaded library with malicious ELF file. The impact is: In worst case attacker may evaluate privileges. The component is: libld. The attack vector is: Attacker sends 2 ELF files to victim and asks to run Idd on it. Idd execute code. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat."
16 CVE-2019-101002		Overflow Bypass	15/07/2019	10/06/2021	7,5 None	Remote Low	Not required		Partial	Partial Complete	"DISPUTED " GNU Libc current is affected by: Miligation bypass. The impact is: Attacker may bypass stack guard protection. The component is: nptl. The attack vector is: Exploit stack buffer overflow vulnerability and use this bypass vulnerability to bypass stack guard. NOTE: Upstream comments indicate "this is being treated as a non-security bug and no real threat." The imputation of the protection of the protection is involved in the protection is involved in the protection of the protection of the protection is involved in the protection of th
17 CVE-2019-25013 18 CVE-2019-19126	125 200	Bypass +Info	04/01/2021 19/11/2019	06/07/2021 21/07/2021	7,1 None 2,1 None	Remote Medium Local Low	Not required Not required		None None	Complete None	The icomv feature in the GNU C Library (aka glibc or libcó) through 2.32, when processing invalid multi-byte input sequences in the EUC-KR encoding, may have a buffer over-read. On the x86-64 architecture, the GNU C Library (aka glibc) before 2.31 fails to ignore the LD_PREFER_MAP_32BIT_EXEC environment variable during program execution after a security transition, allowing local attackers to restrict the possible mapping addresses for loaded libraries and thus bypass ASLR for a setuid program.
19 CVE-2019-9192	674		26/02/2019	24/08/2020	5 None	Remote Low	Not required	None	None	Partial	** DISPUTED ** In the GNU C Library (aka glibc or libc6) through 2.29, check_dst_limits_calc_pos_1 in posiv/regexec.c has Uncontrolled Recursion, as demonstrated by '()\(\1\1\1)" in grep, a different issue than CVE-2018-20796. NOTE: the software maintainer disputes that this is a vulnerability because the behavior occurs only with a crafted pattern.
20 CVE-2019-9169 21 CVE-2019-7309	125		26/02/2019 03/02/2019	09/07/2020 24/08/2020	7,5 None 2,1 None	Remote Low Local Low	Not required Not required		Partial None	Partial Partial	In the GNU C Library (aka glibc or libcó) through 2.29, proceed_next_node in posix/regexec.c has a heap-based buffer over-read via an attempted case-insensitive regular-expression match. In the GNU C Library (aka glibc or libcó) through 2.29, the memomp function for the x32 architecture can incorrectly return zero (indicating that the inputs are equal) because the RDX most significant bit is mishandled.
22 CVE-2019-6488	404		18/01/2019	13/06/2020	4,6 None	Local Low	Not required			Partial	The string component in the GNU C Library (aka gilbc or libcó) through 2.28, when running on the x32 architecture, incorrectly attempts to use a 64-bit register for size_t in assembly codes, which can lead to a segmentation fault or possibly unspecified other impact, as demonstrated by a crash inmemmove_avx_unaligned_erms in sysdeps/x86_64/multiarch/memmove-vec-unaligned-erms. S during a memcpy.
23 CVE-2018-100000 24 CVE-2018-20796	787 674	Exec Code	31/01/2018 26/02/2019	03/10/2019 05/11/2019	7,2 None 5 None	Local Low	Not required	•	-	Complete	In glibc 2.26 and earlier there is confusion in the usage of getcwd() by realpath() which can be used to write before the destination buffer leading to a buffer underflow and potential code execution.
25 CVE-2018-19591	20		04/12/2018	09/07/2020	5 None	Remote Low Remote Low	Not required Not required	None None	None None	Partial Partial	In the GNU C Library (aka glibc or libcó) through 2.29, check_dst_limits_calc_pos_1 in posix/regexec.c has Uncontrolled Recursion, as demonstrated by '(227)(\\1\1 1\ \1\257)\+' in grep. In the GNU C Library (aka glibc or libcó) through 2.28, attempting to resolve a crafted hostname via getaddrinfo() leads to the allocation of a socket descriptor that is not closed. This is related to the if_nametoindex() function.
26 CVE-2018-11237	787	Overflow	18/05/2018	24/08/2020	4,6 None	Local Low	Not required		Partial	Partial	An AVX-512-optimized implementation of the mempcpy function in the GNU C Library (aka glibc or libcé) 2.27 and earlier may write data beyond the target buffer, leading to a buffer overflow inmempcpy_avx512_no_vzeroupper.
27 CVE-2018-11236 28 CVE-2018-6551	787 787	Exec Code Overflow	18/05/2018 02/02/2018	24/08/2020 24/08/2020	7,5 None 7,5 None	Remote Low Remote Low	Not required Not required		Partial Partial	Partial Partial	stdlib/canonicalize.c in the GNU C Library (aka gilbc or libc6) 2.27 and earlier, when processing very long pathname arguments to the realpath function, could encounter an integer overflow on 32-bit architectures, leading to a stack-based buffer overflow and, potentially, arbitrary code execution. The malloc implementation in the GNU C Library (aka gilbc or libc6), from version 2.24 to 2.26 on powerpc, and only in version 2.26 on i386, did not properly handle malloc calls with arguments close to SIZE_MAX and could return a pointer to a heap region that is smaller than requested, eventually leading to heap corruption.
29 CVE-2018-6485	787	Overflow	01/02/2018	24/08/2020	7,5 None	Remote Low	Not required			Partial	An integer overflow in the implementation of the posix_memalign functions in the GNU C Library (aka glibc or libcó) 2.26 and earlier could cause these functions to return a pointer to a heap area that is too small, potentially leading to heap corruption.
30 CVE-2017-100040		Overflow	01/02/2018	04/04/2019	6,9 None	Local Medium	Not required	* .	-	Complete	A buffer overflow in glibc 2.5 (released on September 29, 2006) and can be triggered through the LD_LIBRARY_PATH environment variable. Please note that many versions of glibc are not vulnerable to this issue if patched for CVE-2017-1000366.
31 CVE-2017-100040 32 CVE-2017-100036	772 119	Exec Code Overflow	01/02/2018 19/06/2017	03/10/2019 15/10/2020	7,2 None 7,2 None	Local Low Local Low	Not required Not required	•	-	Complete Complete	A memory leak in glibc 2.1.1. (released on May 24, 1999) can be reached and amplified through the LD_HWCAP_MASK environment variable. Please note that many versions of glibc are not vulnerable to this issue if patched for CVE-2017-1000366. glibc contains a vulnerability that allows specially crafted LD_LIBRARY_PATH values to manipulate the heap/stack, causing them to alias, potentially resulting in arbitrary code execution. Please note that additional hardening changes have been made to glibc to prevent manipulation of stack and heap memory but these issues are not directly exploitable, as such they have not been given a CVE. This affects glibc 2.25 and earlier.
33 CVE-2017-17426	190	Overflow	05/12/2017	15/12/2017	6,8 None	Remote Medium	Not required	* .	Partial	Partial	The malloc function in the GNU C Library (aka glibc or libcó) 2.26 could return a memory block that is too small if an attempt is made to allocate an object whose size is close to SIZE_MAX, potentially leading to a subsequent heap overflow. This occurs because the per-thread cache (aka tcache) feature enables a code path that lacks an integer overflow check.
34 CVE-2017-16997 35 CVE-2017-15804	426 119	Overflow	18/12/2017 22/10/2017	15/10/2020 20/06/2018	9,3 None 7,5 None	Remote Medium Remote Low	Not required Not required	* .	Complete Partial	Complete Partial	elfidl-load.c in the GNU C Library (aka gilbc or libcá) 2.19 through 2.26 mishandles RPATH and RUNPATH containing \$ORIGIN for a privileged (setuid or AT_SECURE) program, which allows local users to gain privileges via a Trojan horse library in the current working directory, related to the fillin_rpath and decompose_rpath functions. This is associated with misinterpretion of an empty RPATH/RUNPATH token as the "./" directory. NOTE: this configuration of RPATH/RUNPATH for a privilege The glob function in glob.c in the GNU C Library (aka gilbc or libcó) before 2.27 contains a buffer overflow during unescaping of user names with the - operator.
36 CVE-2017-15671	772	DoS	20/10/2017	03/10/2019	4,3 None	Remote Medium	Not required		None	Partial	The glob function in glob,c in the GNU C Library (aka glibc or libco) before 2.27, when invoked with GLOB_TILDE, could skip freeing allocated memory when processing the - operator with a long user name, potentially leading to a denial of service (memory leak).
37 CVE-2017-15670	119	Overflow	20/10/2017	20/06/2018	7,5 None	Remote Low	Not required		Partial	Partial	The GNU C Library (aka glibc or libc6) before 2.27 contains an off-by-one error leading to a heap-based buffer overflow in the glob function in glob.c, related to the processing of home directories using the - operator followed by a long string.
38 CVE-2017-12133 39 CVE-2017-12132	416 770		07/09/2017 01/08/2017	09/07/2020 03/10/2019	4,3 None 4,3 None	Remote Medium Remote Medium	Not required Not required		Partial Partial	None None	Use-after-free vulnerability in the clntudp_call function in sunrpc/clnt_udp.c in the GNU C Library (aka glibc or libc6) before 2.26 allows remote attackers to have unspecified impact via vectors related to error path. The DNS stub resolver in the GNU C Library (aka glibc or libc6) before version 2.26, when EDNS support is enabled, will solicit large UDP responses from name servers, potentially simplifying off-path DNS spoofing attacks due to IP fragmentation.
40 CVE-2017-8804	502	DoS	07/05/2017	26/08/2020	7,8 None	Remote Low	Not required		None	Complete	** DISPUTED ** The xdr_bytes and xdr_string functions in the GNU C Library (aka gilbc or libcó) 2.25 mishandle failures of buffer deserialization, which allows remote attackers to cause a denial of service (virtual memory allocation, or memory consumption if an overcommit setting is not used) via a crafted UDP packet to port 111, a related issue to CVE-2017-8779. NOTE: [Information provided from upstream and references]
41 CVE-2016-10739 42 CVE-2016-10228	20 20	DoS	21/01/2019 02/03/2017	06/08/2019 25/02/2021	4,6 None 4,3 None	Local Low Remote Medium	Not required Not required		Partial None	Partial Partial	In the GNU C Library (aka glibc or libcó) through 2.28, the getaddrinfo function would successfully parse a string that contained an IPv4 address followed by whitespace and arbitrary characters, which could lead applications to incorrectly assume that it had parsed a valid string, without the possibility of embedded HTTP headers or other potentially dangerous substrings. The iconv program in the GNU C Library (aka glibc or libcó) 2.31 and earlier, when invoked with multiple suffixes in the destination encoding (TRANSLATE or IGNORE) along with the -c option, enters an infinite loop when processing invalid multi-byte input sequences, leading to a denial of service.
43 CVE-2016-6323	284	DoS	07/10/2016	30/10/2018	5 None	Remote Low	Not required		None	Partial	The makecontext function in the GNU C Library (aka gilbc or libcó) before 2.25 creates execution contexts incompatible with the unwinder on ARM EABI (32-bit) platforms, which might allow context-dependent attackers to cause a denial of service (hang), as demonstrated by applications compiled using gccgo, related to backtrace generation.
44 CVE-2016-5417	399	DoS	17/02/2017	17/02/2017	5 None	Remote Low	Not required		None	Partial	Memory leak in the _res_vinit function in the IPv6 name server management code in libresolv in GNU C Library (aka glibc or libc6) before 2.24 allows remote attackers to cause a denial of service (memory consumption) by leveraging partial initialization of internal resolver data structures.
45 CVE-2016-4429 46 CVE-2016-3706	787 20	DoS Overflow DoS Overflow	10/06/2016 10/06/2016	20/07/2021 29/10/2020	4,3 None 5 None	Remote Medium Remote Low	Not required Not required		None None	Partial Partial	Stack-based buffer overflow in the clntudp_call function in sumpcicint_udp.c in the GNU C Library (aka glibc or libc6) allows remote servers to cause a denial of service (crash) or possibly unspecified other impact via a flood of crafted ICMP and UDP packets. Stack-based buffer overflow in the getaddrinfo function in sysdeps/posix/getaddrinfo.c in the GNU C Library (aka glibc or libc6) allows remote attackers to cause a denial of service (crash) via vectors involving hostent conversion. NOTE: this vulnerability exists because of an incomplete fix for CVE-2013-4458.
47 CVE-2016-3075	119	DoS Overflow	01/06/2016	30/10/2018	5 None	Remote Low	Not required		None	Partial	Stack-based buffer overflow in the nss_dns implementation of the getnetbyname function in GNU C Library (aka glibc) before 2.24 allows context-dependent attackers to cause a denial of service (stack consumption and application crash) via a long name.
48 CVE-2016-1234 49 CVE-2015-8985	119 19	DoS Overflow DoS	01/06/2016 20/03/2017	01/09/2021 31/03/2020	5 None 4,3 None	Remote Low Remote Medium	Not required Not required		None None	Partial Partial	Stack-based buffer overflow in the glob implementation in GNU C Library (aka glibc) before 2.24, when GLOB_ALTDIRFUNC is used, allows context-dependent attackers to cause a denial of service (crash) via a long name. The pop_fail_stack function in the GNU C Library (aka glibc or libcó) allows context-dependent attackers to cause a denial of service (assertion failure and application crash) via vectors related to extended regular expression processing.
50 CVE-2015-8984	125	DoS	20/03/2017	22/03/2017	4,3 None	Remote Medium	Not required		None	Partial	The finmatch function in the GNU C Library (aka glibc or libcs) before 2.22 might allow context-dependent attackers to cause a denial of service (application crash) via a malformed pattern, which triggers an out-of-bounds read.
51 CVE-2015-8983 52 CVE-2015-8982	190	DoS Exec Code Overflow DoS Exec Code Overflow	20/03/2017	22/03/2017	6,8 None	Remote Medium	Not required		Partial	Partial	Integer overflow in the _IO_wstr_overflow function in libio/wstrops.c in the GNU C Library (aka gilbo or libo6) before 2.22 allows context-dependent attackers to cause a denial of service (application crash) or possibly execute arbitrary code via vectors related to computing a size in bytes, which triggers a heap-based buffer overflow.
52 CVE-2015-8982 53 CVE-2015-8779	190 119	DoS Exec Code Overflow	15/03/2017 19/04/2016	29/06/2021 30/10/2018	6,8 None 7,5 None	Remote Medium Remote Low	Not required Not required		Partial Partial	Partial Partial	Integer overflow in the strxfrm function in the GNU C Library (aka glibc or libcó) before 2.21 allows context-dependent attackers to cause a denial of service (crash) or possibly execute arbitrary code via a long string, which triggers a stack-based buffer overflow. Stack-based buffer overflow in the catopen function in the GNU C Library (aka glibc or libcó) before 2.23 allows context-dependent attackers to cause a denial of service (application crash) or possibly execute arbitrary code via a long catalog name.
54 CVE-2015-8778	119	DoS Exec Code Overflow	19/04/2016	30/10/2018	7,5 None	Remote Low	Not required	Partial	Partial	Partial	Integer overflow in the GNU C Library (aka gilbo or libcó) before 2.23 allows context-dependent attackers to cause a denial of service (application crash) or possibly execute arbitrary code via the size argument to the _hcreate_r function, which triggers out-of-bounds heap-memory access.
55 CVE-2015-8777 56 CVE-2015-8776	254 189	Bypass DoS +Info	20/01/2016 19/04/2016	05/01/2018 30/10/2018	2,1 None 6,4 None	Local Low Remote Low	Not required Not required		Partial None	None Partial	The process_envars function in elfritid c. in the GNU C Library (aka glibc or libc6) before 2.23 allows local users to bypass a pointer-guarding protection mechanism via a zero value of the LD_POINTER_GUARD environment variable. The strifime function in the GNU C Library (aka glibc or libc6) before 2.23 allows context-dependent attackers to cause a denial of service (application crash) or possibly obtain sensitive information via an out-of-range time value.
57 CVE-2015-7547	119	DoS Exec Code Overflow	18/02/2016	01/09/2021	6,8 None	Remote Medium	Not required	Partial	Partial	Partial	Multiple stack-based buffer overflows in the (1) send_dg and (2) send_vc functions in the library in the GNU C Library (aka glibc or libc6) before 2.23 allow remote attackers to cause a denial of service (crash) or possibly execute arbitrary code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library in the GNU C Library (aka glibc or libc6) before 2.23 allow remote attackers to cause a denial of service (crash) or possibly execute arbitrary code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response that triggers a call to the getaddrinfo function with the AF_UNSPEC or AF_INET6 address family, related to performing "dual A/AAAA DNS queries" and the library code via a crafted DNS response to the library code via a crafted DNS response to the library code via a crafted DNS response to the library code via a crafted DNS response to the library code via a crafted DNS response to the library code via a crafted DNS response to the library code via a crafted DNS response to
58 CVE-2015-5277 59 CVE-2015-5180	119 476	DoS Overflow +Priv DoS	17/12/2015 27/06/2017	01/07/2017 12/04/2018	7,2 None 5 None	Local Low Remote Low	Not required Not required	•	-	Complete Partial	The get_contents function in nss_files/files-XXX.c in the Name Service Switch (NSS) in GNU C Library (aka glibc or libcé) before 2.20 might allow local users to cause a denial of service (heap corruption) or gain privileges via a long line in the NSS files database. res_query in libresolv in glibc before 2.25 allows remote attackers to cause a denial of service (NULL pointer dereference and process crash).
60 CVE-2015-1781	476 119	DoS Exec Code Overflow	27/06/2017 28/09/2015	12/04/2018 17/06/2019	5 None 6,8 None	Remote Low Remote Medium	Not required Not required		None Partial	Partial Partial	res_query in libresolv in glibc before 2.25 allows remote attackers to cause a denial of service (NULL pointer dereference and process crash). Buffer overflow in the gethostbyname_r and other unspecified NSS functions in the GNU C Library (aka glibc or libc6) before 2.22 allows context-dependent attackers to cause a denial of service (crash) or execute arbitrary code via a crafted DNS response, which triggers a call with a misaligned buffer.
61 CVE-2015-1473	119	DoS Overflow	08/04/2015	28/11/2016	6,4 None	Remote Low	Not required	None	Partial	Partial	The ADDW macro in stdio-common/vfscanf.c in the GNU C Library (aka glibc or libc6) before 2.21 does not properly consider data-type size during a risk-management decision for use of the alloca function, which might allow context-dependent attackers to cause a denial of service (segmentation violation) or overwrite memory locations beyond the stack boundary via a long line containing wide characters that are improperly handled in a wscanf call.
62 CVE-2015-1472 63 CVE-2015-0235	119 787	DoS Overflow Exec Code Overflow	08/04/2015 28/01/2015	13/06/2019 01/09/2021	7,5 None 10 None	Remote Low Remote Low	Not required Not required		Partial Complete	Partial Complete	The ADDW macro in stdio-common/fscanf.c in the GNU C Library (aka glibc or libc6) before 2.21 does not properly consider data-type size during memory allocation, which allows context-dependent attackers to cause a denial of service (buffer overflow) or possibly have unspecified other impact via a long line containing wide characters that are improperly handled in a wscanf call. Heap-based buffer overflow in thenss_hostname_digits_dots function in gilbc 2.2, and other 2.x versions before 2.18, allows context-dependent attackers to execute arbitrary code via vectors related to the (1) gethostbyname or (2) gethostbyname or (2) gethostbyname or (3) gethostbyname or (3) gethostbyname or (3) gethostbyname or (4) gethostbyname or (4) gethostbyname or (5) gethostbyname or (6) gethostbyname or (6) gethostbyname or (6) gethostbyname or (6) gethostbyname or (7) gethostbyname or (8) get
64 CVE-2014-9984	119	Exec Code Overflow	12/06/2017	13/06/2019	7,5 None	Remote Low	Not required	Partial	Partial .	Partial	nscd in the GNU C Library (aka glibc or libc6) before version 2.20 does not correctly compute the size of an internal buffer when processing netgroup requests, possibly leading to an nscd daemon crash or code execution as the user running nscd.
65 CVE-2014-9761 66 CVE-2014-9402	119 399	DoS Exec Code Overflow DoS	19/04/2016 24/02/2015	13/06/2019 13/06/2019	7,5 None 7,8 None	Remote Low Remote Low	Not required Not required		Partial None	Partial Complete	Multiple stack-based buffer overflows in the GNU C Library (aka gilbc or libc6) before 2.23 allow context-dependent attackers to cause a denial of service (application crash) or possibly execute artifirary code via a long argument to the (1) nan, (2) nanf., or (3) nanl function. The nss_dns implementation of getnetbyname in GNU C Library (aka gilbc) before 2.21, when the DNS backend in the Name Service Switch configuration is enabled, allows remote attackers to cause a denial of service (infinite loop) by sending a positive answer while a network name is being process.
67 CVE-2014-8121	17	DoS	27/03/2015	17/10/2018	5 None	Remote Low	Not required	None	None	Partial	DB_LOOKUP in nss_files/files-XXX.c in the Name Service Switch (NSS) in GNU C Library (aka glibc or libcó) 2.21 and earlier does not properly check if a file is open, which allows remote attackers to cause a denial of service (infinite loop) by performing a look-up on a database while iterating over it, which triggers the file pointer to be reset.
68 CVE-2014-7817 69 CVE-2014-6040	20 119	Exec Code DoS Overflow	24/11/2014 05/12/2014	30/10/2018 03/01/2017	4,6 None 5 None	Local Low Remote Low	Not required Not required		Partial None	Partial Partial	The wordexp function in GNU C Library (aka glibc) 2.21 does not enforce the WRDE_NOCMD flag, which allows context-dependent attackers to execute arbitrary commands, as demonstrated by input containing "\$(())*. GNU C Library (aka glibc) before 2.20 allows context-dependent attackers to cause a denial of service (out-of-bounds read and crash) via a multibyte character value of "0xffff" to the iconv function when converting (1) IBM935, (3) IBM937, (4) IBM939, or (5) IBM1364 encoded data to UTF-8.
70 CVE-2014-5119	189	DoS Exec Code	29/08/2014	31/03/2020	7,5 None	Remote Low	Not required			Partial	Off-by-one error in thegoonv_translit_find function in goonv_trans.c in GNU C Library (aka glibc) allows context-dependent attackers to cause a denial of service (crash) or execute arbitrary code via vectors related to the CHARSET environment variable and goonv transliteration modules.
71 CVE-2014-4043	94		06/10/2014	13/06/2019	7,5 None	Remote Low	Not required	Partial	Partial	Partial	The posix_spawn_file_actions_addopen function in glibc before 2.20 does not copy its path argument in accordance with the POSIX specification, which allows context-dependent attackers to trigger use-after-free vulnerabilities.
72 CVE-2014-0475 73 CVE-2013-7424	22 17	Dir. Trav. Bypass DoS Exec Code	29/07/2014 26/08/2015	28/11/2016 28/11/2016	6,8 None 5,1 None	Remote Medium Remote High	Not required Not required		Partial Partial	Partial Partial	Multiple directory traversal vulnerabilities in GNU C Library (aka gilbc or libcó) before 2.20 allow context-dependent attackers to bypass ForceCommand restrictions and possibly have other unspecified impact via a (dot dot) in a (1) LC_*, (2) LANG, or other locale environment variable. The getaddrinfo function in gilbc before 2.15, when compiled with libidn and the A_IDN flag is used, allows context-dependent attackers to cause a denial of service (invalid free) and possibly execute arbitrary code via unspecified vectors, as demonstrated by an internationalized domain name to ping6.
74 CVE-2013-7423	17		24/02/2015	01/09/2021	5 None	Remote Low	Not required		Partial	None	The send_dg function in resolvires_send.c in GNU C Library (aka glibc or libcó) before 2.20 does not properly reuse file descriptors, which allows remote attackers to send DNS queries to unintended locations via a large number of requests that trigger a call to the getaddrinfo function.
75 CVE-2013-4788 76 CVE-2013-4458	20 119	Overflow DoS Overflow	04/10/2013 12/12/2013	01/07/2017 01/07/2017	5,1 None 5 None	Remote High Remote Low	Not required Not required		Partial None	Partial Partial	The PTR_MANGLE implementation in the GNU C Library (aka gilibc or libcó) 2.4, 2.17, and earlier, and Embedded GLIBC (EGLIBC) does not initialize the random value for the pointer guard, which makes it easier for context-dependent attackers to control execution flow by leveraging a buffer-overflow vulnerability in an application and using the known zero value pointer guard to calculate a pointer address. Stack-based buffer overflow in the getaddrinfo function in sysdeps/posix/getaddrinfo.c in GNU C Library (aka gilibc or libcó) 2.18 and earlier allows remote attackers to cause a denial of service (crash) via a (1) hostname or (2) IP address results. NOTE: this vulnerability exists because of an incomplete fix for CVE-2013-1914.
77 CVE-2013-4412	476	DOS OVETTION	04/11/2019	04/11/2019	5 None	Remote Low	Not required		None	Partial	Slack-bases but no eventow in the genatural nutrition in systems possing enabling the control of but and give the number of the control of th
78 CVE-2013-4332	189	DoS Overflow	09/10/2013	01/07/2017	4,3 None	Remote Medium	Not required		None	Partial	Multiple integer overflows in mailor/mallor.c. in the GNU C Library (also glibc or libro), 2.18 and earlier allow context-dependent attackers to cause a denial of service (heap corruption) via a large value to the (1) pvallor, (2) posix_memalign, (4) memalign, or (5) aligned_alloc functions.
79 CVE-2013-4237 80 CVE-2013-2207	119 264	DoS Exec Code Overflow	09/10/2013 09/10/2013	01/07/2017 01/07/2017	6,8 None 2,6 None	Remote Medium Local High	Not required Not required		Partial Partial	Partial None	sysdeps/posix/readdir_r.c in the GNU C Library (aka gilbc or libc6) 2.18 and earlier allows context-dependent attackers to cause a denial of service (out-of-bounds write and crash) or possibly execute arbitrary code via a crafted (1) NTFS or (2) CIFS image. pt_chown in GNU C Library (aka gilbc or libc6) before 2.18 does not properly check permissions for tty files, which allows local users to change the permission on the files and obtain access to arbitrary pseudo-terminals by leveraging a FUSE file system.
81 CVE-2013-1914	119	DoS Overflow	29/04/2013	01/09/2021	5 None	Remote Low	Not required	None	None	Partial	Stack-based buffer overflow in the getaddrinfo function in sysdeps/posix/getaddrinfo.c in GNU C Library (aka glibc or libc6) 2.17 and earlier allows remote attackers to cause a denial of service (crash) via a (1) hostname or (2) IP address that triggers a large number of domain conversion results.
82 CVE-2013-0242 83 CVE-2012-6656	119 20	DoS Overflow Mem. 84 CVE-2012-4424	119	DoS Exec Code Overflow	09/10/2013	01/07/2017	5 None 5,1 None	Remote Low Remote High	Not required Not required	None Partial	None Partial	Partial Partial	iconvidata/ibm930.c in GNU C Library (aka gilbc) before 2.16 allows context-dependent attackers to cause a denial of service (out-of-bounds read) via a multibyte character value of "0xffff" to the iconv function when converting IBM930 encoded data to UTF-8. Stack-based buffer overflow in string/strootl_Lc in the GNU C Library (aka gilbc or libcó) 2.17 and earlier allows context-dependent attackers to cause a denial of service (crash) or possibly execute arbitrary code via a long string that triggers a malloc failure and use of the alloca function.
85 CVE-2012-4412	189	DoS Exec Code Overflow	09/10/2013	13/06/2019	7,5 None	Remote Low	Not required	Partial	Partial	Partial	Integer overflow in string/strcoll_Lc in the GNU C Library (aka glibc or libc6) 2.17 and earlier allows context-dependent attackers to cause a denial of service (crash) or possibly execute arbitrary code via a long string, which triggers a heap-based buffer overflow.
86 CVE-2012-3480 87 CVE-2012-3406	189 264	DoS Exec Code Overflow DoS Exec Code Bypass	25/08/2012 10/02/2014	01/07/2017 22/04/2019	4,6 None 6,8 None	Local Low Remote Medium	Not required Not required		Partial Partial	Partial Partial	Multiple integer overflows in the (1) strtod, (2) strtod, (3) strtold, (4) strtod_1, and other unspecified "related functions" in stdlib in GNU C Library (aka glibc or libc6) 2.16 allow local users to cause a denial of service (application crash) and possibly execute arbitrary code via a long string, which triggers a stack-based buffer overflow. The vfprintf function in stdio-commonly/rprintf.c in GNU C Library (aka glibc) 2.5, 2.12, and probably other versions does not "properly restrict the use of" the alloca function mechanism and cause a denial of service (crash) or possibly execute arbitrary code via a crafted format string using positional parameters and a large number of format specifiers, a difference of the alloca function in stdio-commonly/rprintf.c in GNU C Library (aka glibc) 2.5, 2.12, and probably other versions does not "properly restrict the use of" the alloca function mechanism and cause a denial of service (crash) or possibly execute arbitrary code via a crafted format string using positional parameters and a large number of format specifiers, a difference of the variance of the property of the pro
88 CVE-2012-3405	189	DoS Bypass	10/02/2014	22/04/2019	5 None	Remote Low	Not required	None	None	Partial	The virpinit function in stdio-common/virpinitf.c in libc in GNU C Library (aka glibc) 2.14 and other versions does not properly calculate a buffer length, which allows context-dependent attackers to bypass the FORTIFY_SOURCE format-string with a large number of format specifiers that triggers "desynchronization within the buffer size handling," a different vulnerability than CVE-2012-3404.
89 CVE-2012-3404 90 CVE-2012-0864	189 189	DoS Bypass Overflow Bypass	10/02/2014 02/05/2013	22/04/2019 03/05/2013	5 None 6,8 None	Remote Low Remote Medium	Not required		None Partial	Partial Partial	The vfprintf function in studio-commonl/vfprintf.c in libic in GNU C Library (aka glibc) 2.12 and other versions does not properly calculate a buffer length, which allows context-dependent attackers to bypass the FORTIFY_SOURCE format-string protection mechanism and cause a denial of service (stack corruption and crash) via a format string that uses positional parameters and many format specifiers. Integer overflow in the vfprintf function in stdio-common/vfprintf.c in glibc 2.14 and other versions allows context-dependent attackers to bypass the FORTIFY_SOURCE protection mechanism, conduct format string attacks, and write to arbitrary memory via a large number of arguments.
91 CVE-2011-5320	119	DoS Overflow	18/10/2017	08/11/2017	2,1 None	Local Low	Not required Not required		None	Partial	integer overnow in the viprinitri function in studio-commoniviprinitr. (in gluc 2.14 and other versions allows context-dependent attackers to dypass the FOR FIFY_SOURCE protection mechanism, conduct format string attacks, and write to arbitrary memory via a large number or arguments. scanf and related functions in glibc before 2.15 allow local users to cause a denial of service (segmentation fault) via a large string of 0s.
92 CVE-2011-4609	399	DoS Exec Code	02/05/2013	03/05/2013	5 None	Remote Low	Not required	None	None	Partial Partial	The svc_run function in the RPC implementation in glibc before 2.15 allows remote attackers to cause a denial of service (CPU consumption) via a large number of RPC connections.
93 CVE-2011-2702 94 CVE-2011-1659	94 189	Exec Code DoS Overflow	27/10/2014 08/04/2011	31/10/2014 09/10/2018	6,8 None 5 None	Remote Medium Remote Low	Not required Not required	Partial None	Partial None	Partial Partial	Integer signedness error in Gilbc before 2.13 and egilbc before 2.13, when using Supplemental Streaming SIMD Extensions 3 (SSSE3) oplimization, allows context-dependent attackers to execute arbitrary code via a negative length parameter to (1) memcpy-ssse3-rep. S, (2) memcpy-ssse3-s, or (3) memset-sse2.S in sysdeps/386/i686/multiarch/, which triggers an out-of-bounds read, as demonstrated using the memcpy function. Integer overflow in posix/finmatch.c in the GNU C Library (aka glibc or libc6) 2.13 and earlier allows context-dependent attackers to cause a denial of service (application crash) via a long UTF8 string that is used in an firmatch call with a crafted pattern argument, a different vulnerability than CVE-2011-1071.
95 CVE-2011-1658	264		08/04/2011	09/10/2018	3,7 None	Local High	Not required	Partial	Partial	Partial	Id.so in the GNU C Library (aka glibc or libc6) 2.13 and earlier expands the \$ORIGIN dynamic string token when RPATH is composed entirely of this token, which might allow local users to gain privileges by creating a hard link in an arbitrary directory to a (1) setuid or (2) setgid program with this RPATH value, and then executing the program with a crafted value for the LD_PRELOAD environment variable, a different vulnerability than CVE-2010-3847 and CVE-2011-0536. NOTE: it is not expe
96 CVE-2011-1095 97 CVE-2011-1089	264 16		10/04/2011 10/04/2011	09/10/2018 07/12/2016	6,2 None 3,3 None	Local High Local Medium	Not required Not required	Complete Partial	Complete Partial	Complete None	locale/programs/locale.c in locale in the GNU C Library (aka gilbo or libo6) before 2.13 does not quote its output, which might allow local users to gain privileges via a crafted localization environment variable, in conjunction with a program that executes a script that uses the eval function. The addmntent function in the GNU C Library (aka gilbo or libo6) 2.13 and earlier does not report an error status for failed attempts to write to the (etc/mtab file, which makes it easier for local users to trigger corruption of this file, as demonstrated by writes from a process with a small RLIMIT_FSIZE value, a different vulnerability than CVE-2010-0296.
98 CVE-2011-1071	399	DoS Exec Code	08/04/2011	09/10/2018	5,1 None	Remote High	Not required			Partial	The GNU C Library (aka glibc or libc6) before 2.12 and Embedded GLIBC (EGLIBC) allow context-dependent attackers to execute arbitrary code or cause a denial of service (memory consumption) via a long UTF8 string that is used in an Inmatch call, aka a "stack extension attack," a related issue to CVE-2010-2898, CVE-2010-1917, and CVE-2007-4782, as originally reported for use of this library by Google Chrome.
99 CVE-2010-4756 100 CVE-2010-4052	399 399	DoS 1 DoS	02/03/2011 13/01/2011	01/09/2021 10/10/2018	4 None 5 None	Remote Low	??? Not required	None None	None None	Partial Partial	The glob implementation in the GNU C Library (aka glibc or libcó) allows remote authenticated users to cause a denial of service (CPU and memory consumption) via crafted glob expressions that do not match any pathnames, as demonstrated by glob expressions in STAT commands to an FTP deamon, a different vulnerability than CVE-2010-2632.
101 CVE-2010-4051		1 DoS Overflow Bypass	13/01/2011	18/06/2021	5 None	Remote Low Remote Low		None None	None None	Partial	Stack consumption vulnerability in the regcomp implementation in the GNU C Library (aka gibbc or libc6) through 2.11.3, and 2.12 x through 2.12.2, allows context-dependent attackers to cause a denial of service (resource exhaustion) via a regular expression containing adjacent repetition operators, as demonstrated by a {10,}{10,}{10,}10,}10,}10,}10,}10,}10,}10,}10,}10,}
102 CVE-2010-3856	264		07/01/2011	13/06/2019	7,2 None	Local Low	Not required	Complete	Complete	Complete	Id.so in the GNU C Library (aka gilbc or libc6) before 2.11.3, and 2.12.x before 2.12.2, does not properly restrict use of the LD_AUDIT environment variable to reference dynamic shared objects (DSOs) as audit objects, which allows local users to gain privileges by leveraging an unsafe DSO located in a trusted library directory, as demonstrated by libpcprofile.so.

	103 CVE-2010-3847	59		07/01/2011	10/10/2018	6,9 None	Local Medium	Not required Comple	-	lete Complete	elf/dl-load.c in ld.so in the GNU C Library (aka glibc or libc6) through 2.11.2, and 2.12.x through 2.12.1, does not properly handle a value of \$ORIGIN for the LD_AUDIT environment variable, which allows local users to gain privileges via a crafted dynamic shared object (DSO) located in an arbitrary directory.
	104 CVE-2010-3192 105 CVE-2010-0830	200 189	Overflow +Info Exec Code	14/10/2010 01/06/2010	31/03/2020 17/08/2017	5 None 5,1 None	Remote Low Remote High	Not required Partial Not required Partial			Certain run-time memory protection mechanisms in the GNU C Library (aka glibc or libc6) prinit argv[0] and backtrace information, which might allow context-dependent attackers to obtain sensitive information from process memory by executing an incorrect program, as demonstrated by a setuid program that contains a stack-based buffer overflow error, related to thefortify_fail function in debug/fortify_fail.c, and thestack_chk_fail (aka stack protection) andchk_fail (aka FORTIFY_SC Integers are not at a crafted ELF program with a negative value for a certain d_tag structure member in the ELF header.
1	106 CVE-2010-0296	20	DoS +Priv	01/06/2010	13/06/2019	7,2 None	Local Low	Not required Comple		lete Complete	The encode_name macro in misc/mntent_r.c in the GNU C Library (aka glibc or libcó) 2.11.1 and earlier, as used by ncpmount and mount.cifs, does not properly handle newline characters in mountpoint names, which allows local users to cause a denial of service (mtab corruption), or possibly mountify mount options and gain privileges, via a crafted mount request.
	107 CVE-2010-0015 108 CVE-2009-5155	255 19	DoS	14/01/2010 26/02/2019	07/12/2016 29/06/2021	7,5 None 5 None	Remote Low Remote Low	Not required Partial Not required None	Partia None		nisInss_prisinis-prod.c in the GNU C Library (aka glibc or libcó) 2.7 and Embedded GLIBC (EGLIBC) 2.10.2 adds information from the passwd adjunct byname map to entries in the passwd map, which allows remote attackers to obtain the encrypted passwords of NIS accounts by calling the getpwnam function. In the GNU C Library (aka glibc or libcó) before 2.28, parse_req_exp in posix/regcomp.c misparses alternatives, which allows attackers to cause a denial of service (assertion failure and application exit) or trigger an incorrect result by attempting a regular-expression match.
	109 CVE-2009-5064	264	503	30/03/2011	19/01/2012	6,9 None	Local Medium	Not required Comple		lete Complete	"DISPUTED ** Idd in the GNU C Library (aka gibc or libcó) 2.13 and earlier allows local users to gain privileges via a Trojan horse executable file linked with a modified loader that omits certain LD_TRACE_LOADED_OBJECTS checks. NOTE: the GNU C Library vendor states *This is just nonsense. There are a gazillion other ways to introduce code if people are downloading arbitrary binaries and install them in appropriate directories or set LD_LIBRARY_PATH etc."
	110 CVE-2009-5029 111 CVE-2009-4881	189 189	DoS Exec Code Overflow DoS Overflow	02/05/2013 01/06/2010	03/05/2013 17/08/2017	6,8 None 5 None	Remote Medium Remote Low	Not required Partial Not required None	Partia None		Integer overflow in the _tzfile_read function in glibc before 2.15 allows context-dependent attrackers to cause a denial of service (crash) and possibly execute arbitrary code via a crafted timezone (TZ) file, as demonstrated using vsftpd. Integer overflow in the _vstrfmon_l function in stdlib/strfmon_Lc in the strfmon implementation in the GNU C Library (aka glibc or libcó) before 2.10.1 allows context-dependent attackers to cause a denial of service (application crash) via a crafted format string, as demonstrated by the %999999999999999999999999999999999999
	112 CVE-2009-4880	189	DoS Overflow	01/06/2010	17/08/2017	5 None	Remote Low	Not required None	None		Multiple integer overflows in the strfmon implementation in the GNU C Library (aka glibc or libcó) 2.10.1 and earlier allow context-dependent attackers to cause a denial of service (memory consumption or application crash) via a crafted format string, as demonstrated by a crafted forma
	113 CVE-2006-7254 114 CVE-2005-3590	19 119	DoS Overflow	10/04/2019 10/04/2019	11/04/2019 11/04/2019	2,1 None 7,5 None	Local Low Remote Low	Not required None Not required Partial	None Partia		The nscd daemon in the GNU C Library (glibc) before version 2.5 does not close incoming client sockets if they cannot be handled by the daemon, allowing local users to carry out a denial of service attack on the daemon. The gelgrouplist function in the GNU C library (glibc) before version 2.3.5, when invoked with a zero argument, writes to the passed pointer even if the specified array size is zero, leading to a buffer overflow and potentially allowing attackers to corrupt memory.
	115 CVE-2004-1453	113	Overnow	31/12/2004	11/10/2017	2,1 None	Local Low	Not required Partial			GNU glibc 2.3.4 before 2.3.4 20040619, 2.3.3 before 2.3.2.20040420, and 2.3.2 before 2.3.2-10 does not restrict the use of LD_DEBUG for a setuid program, which allows local users to gain sensitive information, such as the list of symbols used by the program.
	116 CVE-2004-1382			31/12/2004	18/10/2016	2,1 None	Local Low	Not required None	Partia		The glibchug script in glibc 2.3.4 and earlier allows local users to overwrite arbitrary files via a symlink attack on temporary files, a different vulnerability than CVE-2004-0968.
	117 CVE-2004-0968 118 CVE-2003-0859		DoS	09/02/2005 15/12/2003	11/10/2017 11/10/2017	2,1 None 4,9 None	Local Low Local Low	Not required None Not required None	Partia None		The catchsegy script in glibc 2.3.2 and earlier allows local users to overwrite files via a symlink attack on temporary files. The getifaddrs function in GNU libc (glibc) 2.2.4 and earlier allows local users to cause a denial of service by sending spoofed messages as other users to the kernel netlink interface.
	119 CVE-2003-0028		Exec Code Overflow	25/03/2003	21/01/2020	7,5 None	Remote Low	Not required Partial			Integer overflow in the xdrmem_getbytes() function, and possibly other functions, of XDR (external data representation) libraries derived from SunRPC, including librs, libc, glibc, and dietlibc, allows remote attackers to execute arbitrary code via certain integer values in length fields, a different vulnerability than CVE-2002-0391.
	120 CVE-2002-1265 121 CVE-2002-1146		DoS DoS Overflow	12/11/2002 11/10/2002	10/10/2017 10/09/2008	5 None 5 None	Remote Low Remote Low	Not required None Not required None	None None		The Sun RPC functionality in multiple libc implementations does not provide a time-out mechanism when reading data from TCP connections, which allows remote attackers to cause a denial of service (hang). The BIND 4 and BIND 8.2x stub resolver libraries, and other libraries such as glibc 2.2.5 and earlier, libc, and libresolv, use the maximum buffer size instead of the actual size when processing a DNS response, which causes the stub resolvers to read past the actual boundary ("read buffer overflow"), allowing remote attackers to cause a denial of service (crash).
1	122 CVE-2002-0684		Exec Code Overflow	12/08/2002	18/10/2016	7,5 None	Remote Low	Not required Partial	Partia	l Partial	Buffer overflow in DNS resolver functions that perform lookup of network names and addresses, as used in BIND 4.9.8 and ported to glibc 2.2.5 and earlier, allows remote malicious DNS servers to execute arbitrary code through a subroutine used by functions such as getnetbyname and genetbyaddr.
	123 CVE-2000-0959 124 CVE-2000-0824		Exec Code	19/12/2000 14/11/2000	10/10/2017 10/10/2017	1,2 None 7,2 None	Local High Local Low	Not required None Not required Comple	Partia ete Comp	ll None llete Complete	glibc2 does not properly clear the LD_DEBUG_OUTPUT and LD_DEBUG environmental variables when a program is spawned from a setuid program, which could allow local users to overwrite files via a symlink attack. The unsetenv function in glibc 2.1.1 does not properly unset an environmental variable is provided twice to a program, which could allow local users to execute arbitrary commands in setuid programs by specifying their own duplicate environmental variables such as LD_PRELOAD or LD_LIBRARY_PATH.
1	125 CVE-2000-0335		Exec code	03/05/2000	10/09/2008	7,5 None	Remote Low	Not required Partial			The resolver in glibc 2.1.3 uses predictable IDs, which allows a local attacker to spoof DNS query results.
1 K11	126 CVE-1999-0199	252		06/10/2020	03/12/2020	7,5 None	Remote Low	Not required Partial	Partia	l Partial	manual/search.lexi in the GNU C Library (aka glibc) before 2.2 lacks a statement about the unspecified Idelete return value upon deletion of a tree's root, which might allow attackers to access a dangling pointer in an application whose developer was unaware of a documentation update from 1999.

OpenCV (Open Source Computer Vision Library) through 3.3 has an out-of-bounds write error in the function FillColorRow1 in utils cop when reading an image file by using cy-imread.

OpenCV 3.0.0 allows remote attackers to cause a denial of service (segfault) via vectors involving corrupt chunks. OpenCV 3.0.0 has a double free issue that allows attackers to execute arbitrary code.

curl and libcurl 7.2x before 7.24.0 do not properly consider special characters during extraction of a pathname from a URL, which allows remote attackers to conduct data-injection attacks via a crafted URL, as demonstrated by a CRLF injection attack on the (1) IMAP, (2) POP3, or (3) SMTP protocol.

content_encoding.c in libcuri 7.10.5 through 7.19.7, when zilb is enabled, does not properly restrict the amount of callback data sent to an application that requests automatic decompression, which might allow remote attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests automatic decompression, which might allow remote attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests automatic decompression, which might allow remote attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests automatic attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests automatic attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests automatic attackers to cause a denial of service (application crash) or have unspecified other impact by sending crafted compressed data to an application that requests a substantial content of the compression o lib/ssluse.c in cURL and libcurl 7.4 through 7.19.5, when OpenSSL is used, does not properly handle a 10' character in a domain name in the subject's Common Name (CN) field of an X.509 certificate, which allows man-in-the-middle attackers to spoof arbitrary SSL servers via a crafted certificate issued by a legitimate Certification Authority, a related issue to CVE-2009-2408.

The redirect implementation in curl and libcurt 5.11 through 7.19.3, when CURLOPT_FOLLOWLOCATION is enabled, accepts arbitrary Location values, which might allow remote HTTP servers to (1) trigger arbitrary requests to intranet servers, (2) read or overwrite arbitrary files via a redirect to a file: URL, or (3) execute arbitrary commands via a redirect to an overwrite arbitrary files via a redirect to a file: URL or (3) execute arbitrary commands via a redirect to an overwrite arbitrary files via a redirect to a file: URL or (3) execute arbitrary commands via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary files via a redirect to a file: URL or (3) execute arbitrary file via a redirect to a file: URL or (3) execute arbitrary file via a redirect to a file: URL or (3) execute arbitrary file via a redirect to a file: URL or (3) execute arbitrary file via a redirect to a file: URL or (4) execute arbitrary file via a redirect to a file: URL or (4) execute arbitrary file via a redirect to a file: URL or (4) execute arbitrary file via a redirect to a file: URL or (4) execute arbitrary file: URL or (4) execute arbitrary file: URL or (4) execute arbitrary file: URL or (4) execute

The parse pat function in the moeds parser in GStreamer before 1.10.2 allows remote attackers to cause a denial of service (NULL pointer dereference and crash) via a crafted file.

The gst_mpegts_section_new function in the mpegts decoder in GStreamer before 1.10.2 allows remote attackers to cause a denial of service (out-of-bounds read) via a too small section. The windows_icon_typefind function in gst-plugins-base in GStreamer before 1.10.2, when G_SLICE is set to always-malloc, allows remote attackers to cause a denial of service (out-of-bounds read) via a crafted ico file.

The gst_decode_chain_free_internal function in the fixdex decoder in gst-plugins-good in GStreamer before 1.10.2 allows remote attackers to cause a denial of service (invalid memory read and crash) via an invalid file, which triggers an incorrect unref call.

Off-by-one error in the gst_h264_parse_set_caps function in GStreamer before 1.10.2 allows remote attackers to have unspecified impact via a crafted file, which triggers an out-of-bounds read.

The FLIC decoder in GStreamer before 1.10.2 allows remote attackers to cause a denial of service (out-of-bounds write and crash) via a crafted series of skip and count pairs. The fix_decode_chunks function in gst/flx/gstflxdec.c in GStreamer before 1.10.2 allows remote attackers to cause a denial of service (invalid memory read and crash) via a crafted FLIC file.

Heap-based buffer overflow in the flx_decode_delta_fii function in qst/fix/qstflxdec.c in the FLIC decoder in GStreamer before 1.10.2 allows remote attackers to execute arbitrary code or cause a denial of service (application crash) by providing a 'write count' that goes beyond the initialized buffer.

Heap-based buffer overflow in the flx_decode_delta_fli function in gstfltx/gstfltxdec.c in the FLIC decoder in GStreamer before 1.10.2 allows remote attackers to execute arbitrary code or cause a denial of service (application crash) by providing a 'skip count' that goes beyond initialized buffer.

Heap-based buffer overflow in the fix_decode_delta_fli function in gst/flix/gstffxdec.c in the FLIC decoder in GStreamer before 1.10.2 allows remote attackers to execute arbitrary code or cause a denial of service (application crash) via the start_line parameter.

Multiple integer overflows in the (1) user_info_callback, (2) user_endrow_callback, and (3) gst_pngdec_task functions (ext/filtppng/gstpngdec.c) in GStreamer Good Plug-ins (aka gst-plugins-good) 0.10.15 allow remote attackers to cause a denial of service and possibly execute arbitrary code via a crafted PNG file, which triggers a buffer overflow.

Integer overflow in the gst_vorbis_lag_add_coverart function (gst-libs/gst/lag/gstvorbistag.c) in vorbistag in gst-plugins-base (aka gstreamer-plugins-base) before 0.10.23 in GStreamer allows context-dependent attackers to execute arbitrary code via a crafted COVERART tag that is converted from a base64 representation, which triggers a heap-based buffer overflow.

Array index error in the gst_qtp_trak_handler function in gst/qtdemux/qtdemux.c in GStreamer Plug-ins (aka gstreamer-plugins) 0.6.0 allows remote attackers to have an unknown impact via a crafted QuickTime media file. Heap-based buffer overflow in the qddemux_parse_samples function in gst/qtdemux/qtdemux.c in GStreamer Good Plug-ins (aka gst-plugins-good) 0.10.9 through 0.10.11, and GStreamer Plug-ins (aka gstreamer-plugins) 0.8.5, might allow remote attackers to execute arbitrary code via crafted Time-to-sample (aka sits) atom data in a malformed QuickTime media .mov file.

Array index error in the oldemux, parse, samples function in ostiloteenus/oldemus/critical in a malformed Quick Time media, moy file related to "mark keyframes". Heap-based buffer overflow in the qtdemux_parse_samples function in gst/qtdemux/qtdemux.c in CStreamer Good Plug-ins (aka gst-plugins-good) 0.10.9 through 0.10.11 might allow remote attackers to execute arbitrary code via crafted Composition Time To Sample (ctts) atom data in a malformed QuickTime media .mov file.

The boot loader in Das U-Boot before 2021.04-rc2 mishandles use of unit addresses in a FIT.

Das U-Boot through 2020.01 allows attackers to bypass verified boot restrictions and subsequently boot arbitrary images by providing a crafted FIT image to a system configured to boot the default configuration. In Das U-Boot through 2020.01, a double free has been found in the cmd/gpt.c do_rename_gpt_parts() function. Double freeing may result in a write-what-where condition, allowing an attacker to execute arbitrary code. NOTE: this vulnerability was introduced when attempting to fix a memory leak identified by static analysis.

An issue was discovered in Das U-Boot through 2019.07. There is a stack-based buffer overflow in this nfs_handler reply helper function: nfs_umountall_reply.

An issue was discovered in Das U-Boot through 2019.07. There is a stack-based buffer overflow in this nfs_handler reply helper function: nfs_mount_reply. An issue was discovered in Das U-Boot through 2019.07. There is a stack-based buffer overflow in this nfs_handler reply helper function: nfs_readlink_reply.

An issue was discovered in Das U-Boot through 2019.07. There is a stack-based buffer overflow in this nfs_handler reply helper function: nfs_lookup_reply.

An issue was discovered in Das U-Boot through 2019.07. There is a stack-based buffer overflow in this nfs_handler reply helper function: rpc_lookup_reply.

An issue was discovered in Das U-Boot Ihrough 2019.07. There is an unbounded memcpy when parsing a UDP packet due to a net_process_received_packet integer underflow during an "udp_packet_handler call.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy with a failed length check at nfs_read_reply when calling store_block in the NFSv3 case.

An issue was discovered in Das U-Boot through 2019.07. There is a read of out-of-bounds data at nfs_read_reply.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy with a failed length check at nfs_lookup_reply.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy with unvalidated length at nfs_readlink_reply in the "else" block after calculating the new path length.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy with a failed length check at nfs_read_reply when calling store_block in the NFSv2 case.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy with an unvalidated length at nfs_readlink_reply, in the "If" block after calculating the new path length.

An issue was discovered in Das U-Boot through 2019.07. There is an unbounded memcpy when parsing a UDP packet due to a net_process_received_packet integer underflow during an nc_input_packet call.

Das U-Boot versions 2016.09 through 2019.07-rc4 can memset() too much data while reading a crafted ext4 filesystem, which results in a stack buffer overflow and likely code execution.

Das U-Boot versions 2019.07-rc1 through 2019.07-rc4 can double-free a cached block of data when listing files in a crafted ext4 filesystem.

In Das U-Boot versions 2016.11-rc1 (brough 2019.07-rc4, an underflow can cause memcpy() to overwrite a very large amount of data (including the whole stack) while reading a crafted ext4 filesystem.

A crafted self-referential DOS partition table will cause all Das U-Boot versions through 2019.07-rc4 to infinitely recurse, causing the stack to grow infinitely and eventually either crash or overwrite other data. qen. rand, uuid in lib/uuid.c in Das U-Boot v2014.04 through v2019.04 lacks an srand call, which allows attackers to determine UUID values in scenarios where CONFIG. RANDOM, UUID is enabled, and Das U-Boot is relied upon for UUID values of a GUID Partition Table of a boot device.

Das U-Boot 2016.11-rc1 through 2019.04 mishandles the ext4 64-bit extension, resulting in a buffer overflow.

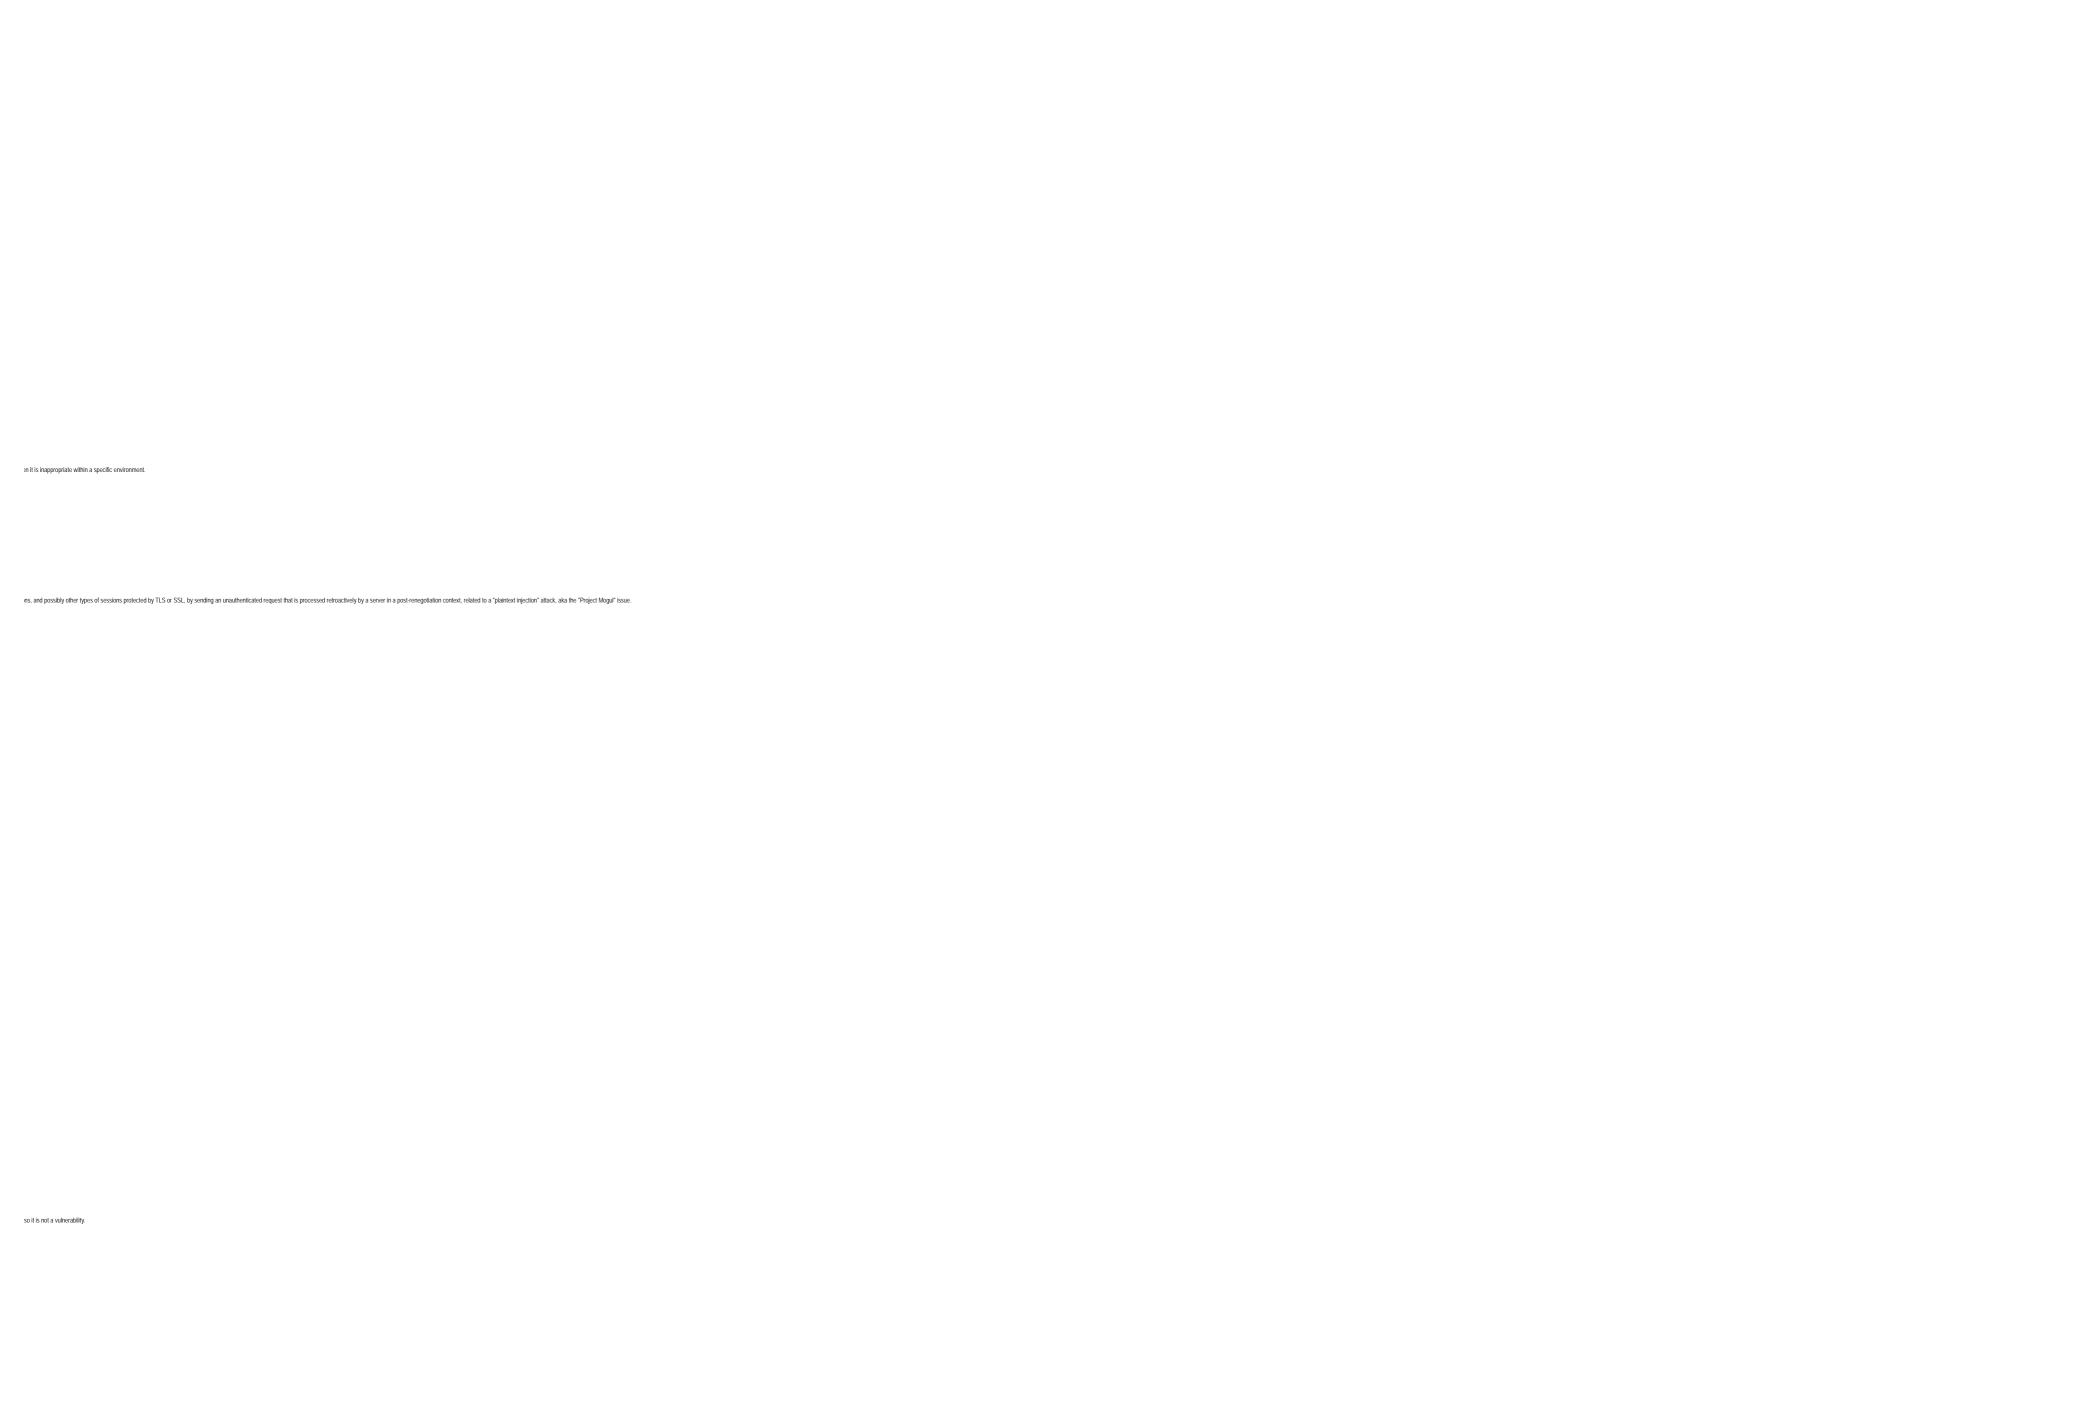

U-Boot contains a CWE-20: Improper Input Validation vulnerability in Verified boot signature validation that can result in Bypass verified boot. This attack appear to be exploitable via Specially crafted FTT image and special device memory functionality.

DENX U-Boot through 2018.09-rc1 has a locally exploitable buffer overflow via a crafted kernel image because filesystem loading is mishandled.

An exploitable vulnerability exists in the verified boot protection of the Das U-Boot from version 2013.07-rc1 to 2014.07-rc2. The affected versions lack proper FTT signature enforcement, which allows an attacker to bypass U-Boot's verified boot and execute an unsigned kernel, embedded in a legacy image format. To trigger this vulnerability, a local attacker needs to be able to supply the image to boot.

Das U-Boot is a device bootloader that can read its configuration from an AES encrypted file. Devices that make use of Das U-Boot's AES-CBC encryption feature using environment variables from disk as the encrypted disk image is processed. An attacker with physical access to the device can manipulate the encrypted environment data to include a crafted two-byte sequence which triggers an erro Das U-Boot is a device bootloader that can read its configuration from an AES encrypted file. For devices utilizing this environment encrypted data produced by Das U-Boot to learn inform
